

Physical Science Module 2 Review Paper

- As is true for all other forms of light, ultraviolet light is also made up of photons. The main difference between ultraviolet and visible light is the frequency of the photons. Ultraviolet photons have a higher frequency than visible photons, which means they have more energy. This is why ultraviolet light can cause sunburns and other skin damage, while visible light cannot. The energy of a photon is directly proportional to its frequency, so higher frequency means higher energy. This is why ultraviolet light is more harmful than visible light. The photons in ultraviolet light have enough energy to break the bonds in the molecules of your skin, which can lead to sunburn and other damage. Visible light photons do not have enough energy to do this. The difference in energy between ultraviolet and visible light is what makes ultraviolet light so much more powerful than visible light. This is why ultraviolet light is used in many applications, such as tanning beds and UV curing lamps. It is also why you should always wear sunscreen when you are outdoors, even on a cloudy day. The sun's rays contain a lot of ultraviolet light, and it can be very harmful to your skin. So, the next time you are outside, make sure you are protected from the sun's rays. Wear your sunscreen, and you will be safe.
