Kirby, 2003-06-16 Numerical algorithms modern programming techniques and parallel computing are often taught serially across different courses and different textbooks The need to integrate concepts and tools usually comes only in employment or in research after the courses are concluded forcing the student to synthesise what is perceived to be three independent subfields into one This book provides a seamless approach to stimulate the student simultaneously through the eyes of multiple disciplines leading to enhanced understanding of scientific computing as a whole The book includes both basic as well as advanced topics and places equal emphasis on the discretization of partial differential equations and on solvers Some of the advanced topics include wavelets high order methods non symmetric systems and parallelization of sparse systems The material covered is suited to students from engineering computer science physics and mathematics Symmetry, Broken Symmetry, and Topology in Modern Physics Mike Guidry, Yang Sun, 2022-03-31 Written for use in teaching and for self study this book provides a comprehensive and pedagogical introduction to groups algebras geometry and topology It assimilates modern applications of these concepts assuming only an advanced undergraduate preparation in physics It provides a balanced view of group theory Lie algebras and topological concepts while emphasizing a broad range of modern applications such as Lorentz and Poincar invariance coherent states quantum phase transitions the quantum Hall effect topological matter and Chern numbers among many others An example based approach is adopted from the outset and the book includes worked examples and informational boxes to illustrate and expand on key concepts 344 homework problems are included with full solutions available to instructors and a subset of 172 of these problems have full solutions available to students *The Circular Economy and Institutional Change* Yilmaz Kaplan, 2025-11-05 The climate crisis has emerged as a consequence of the linear economic system that developed in the aftermath of the Industrial Revolution In recent years global actors have recognised the need for institutional change from the linear economy to a more sustainable alternative The circular economy This book analyses the potential for transformative institutional change to a circular economy both in theory and in practice At the theoretical level the book evaluates the feasibility of transitioning from a linear economy system to a circular economy by drawing on the principles of New Institutionalism It thoroughly examines the key parameters of institutional change focusing on the role of actors and new ideas within the institutional change process Building upon this

theoretical framework the book then delves into the practical implementations of key actors It first explores the role of the state and the market as crucial institutional actors referencing the historical debate between these two entities Additionally the book critically assesses the agenda setting power of influential international organisations specifically the United Nations and the World Trade Organization in driving a circular institutional change Furthermore it analyses the circular economy policies of influential global actors such as the European Union China Japan and the USA Aligned with these analyses the book also examines the potential of a circular institutional change to bring about a paradigm shift from the prevailing industrial and consumer centric society to an ecologically oriented society This book is invaluable for readers interested in the circular economy new institutionalism the impacts of climate change and alternative economic policy
