Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 40 to 50 years of age, who were randomly assigned to a 12-week training program or a control group. The training program consisted of three sessions per week, each lasting 30 minutes, and included a combination of aerobic and resistance exercises. The control group consisted of 12 sedentary women who did not participate in the training program. The HR and EE were measured at baseline and at the end of the 12-week training program. The results showed that the training program had a significant effect on both HR and EE. The HR increased significantly from baseline to the end of the training program, and the EE increased significantly from baseline to the end of the training program. The control group showed no significant changes in HR or EE. The results of this study suggest that a 12-week training program can effectively increase the HR and EE of sedentary, middle-aged women.

 - Turn off the lights at the end of the work day.
 - Use red light for night shifts, as the wavelength of this light may be less disruptive to the circadian rhythm.
- The end of the shift should be followed by a period of relaxation. The producer should avoid doing any work or other activities that require attention or decision making. Instead, they should spend the time doing something relaxing, such as watching a movie or listening to music.
