A Refined Approach for Forecasting Based on Neutrosophic Time Series Mohamed Abdel-Basset, Victor Chang, Mai Mohamed, Florentin Smarandache, This research introduces a neutrosophic forecasting approach based on neutrosophic time series NTS Historical data can be transformed into neutrosophic time series data to determine their truth indeterminacy and falsity functions The basis for the neutrosophication process is the score and accuracy functions of historical data In addition neutrosophic logical relationship groups NLRGs are determined and a deneutrosophication method for NTS is presented The objective of this research is to suggest an idea of first and high order NTS By comparing our approach with other approaches we conclude that the suggested approach of forecasting gets better results compared to the other existing approaches of fuzzy intuitionistic fuzzy

The Underrepresentation of Women in Science: International and Cross-Disciplinary Evidence and Debate

Stephen J. Ceci, Wendy M. Williams, Shulamit Kahn, 2018-04-20 There is no shortage of articles and books exploring women's underrepresentation in science. Everyone is interested: academics, politicians, parents, high school girls and boys, women in search of college majors, administrators working to accommodate women's educational interests: the list goes on. But one thing often missing is an evidence-based examination of the problem, uninfluenced by personal opinions, accounts of lived experiences, anecdotes, and the always encroaching inputs of popular culture. This is why this special issue of *Frontiers in Psychology* can make a difference. In it, a diverse group of authors and researchers with even more diverse viewpoints find themselves united by their empirical, objective approaches to understanding women's underrepresentation in science today. The questions considered within this special issue span academic disciplines, methods, levels of analysis, and nature of analysis. What these articles share is their scholarly, evidence-based approach to understanding a key issue of our time.

The Will to Predict Eglė Rindzevičiūtė, 2023-05-15 In *The Will to Predict*, Eglė Rindzevičiūtė demonstrates how the logic of scientific expertise cannot be properly understood without knowing the conceptual and institutional history of scientific prediction. She notes that predictions of future population, economic growth, environmental change, and scientific and technological innovation have shaped much of twentieth and twenty-first century politics and social life, as well as government policies. Today, such predictions are more necessary than ever as the world undergoes dramatic environmental, political, and technological change. But she asks: what does it mean to predict scientifically? What are the limits of scientific prediction, and what are its effects on governance, institutions, and society? Her intellectual and political history of scientific prediction takes as its example twentieth-century USSR. By outlining the role of prediction in a range of governmental contexts, from economic and social planning to military strategy, she shows that the history of scientific prediction is a transnational one, part of the history of modern science and technology, as well as governance. Going beyond the Soviet case, Rindzevičiūtė argues that scientific predictions are central for organizing uncertainty through the orchestration of knowledge and action. Bridging the fields of political sociology, organization studies, and history, *The Will to Predict* considers what makes knowledge scientific and how such knowledge has impacted late modern governance.

Mathematics for Healthcare Krasimira Tsaneva-Atanasova, Vanessa Diaz-Zuccarini, 2018-09-28 In 1996, and with extraordinary prescience, Panfilov and Holden had highlighted in their seminal book *Computational Biology of the Heart* that biology was potentially the most mathematical of all sciences. Fast forward 20 years, and we have seen an explosion of applications of mathematics in not only biology but healthcare, that has already produced significant breakthroughs not imaginable more than 20 years ago. Great strides have been made in explaining, through quantitative methods, the underlying mechanisms of human disease, not without considerable ingenuity and effort. Biological mechanisms are bewilderingly complex, ever-evolving, multi-scale, variable, difficult to fully access and understand. This poses immense challenges to the

computational physiology community that nevertheless has developed an impressive arsenal of tools and methods in a vertiginous race to combat disease with the tall order of improving human healthcare Mechanistic models are now contending with the advent of machine learning in healthcare and the hope is that both approaches will be used synergistically since the complexity of human patophysiology and the difficulty of acquiring human datasets will require both deductive and inductive methods This Research Topic presents work that is currently at the frontier in computational physiology with a striking range of applications from diabetes to graft failure and using a multitude of mathematical tools This collection of articles represents a snapshot in a field that is moving a dizzying speed bringing understanding of fundamental mechanism and solutions to healthcare problems experienced by healthcare systems all over the world
