

HYPOTHESIS

A hypothesis is a tentative statement or explanation that proposes a possible relationship between variables and is subject to testing and verification.

OVERVIEW

A hypothesis is a testable prediction that seeks to explain a phenomenon or make a statement about the relationship between variables. It is formulated based on prior knowledge, observations, or theories. Hypotheses serve as a starting point for scientific investigation, and their validity is assessed through empirical evidence.

EXAMPLES

Null Hypothesis: The null hypothesis is a statement that suggests no significant relationship or effect between variables.

Alternative Hypothesis: The alternative hypothesis is a statement that proposes a specific relationship or effect between variables, challenging the null hypothesis.

Hooker,2012-12-06 In May of 1973 we organized an international research colloquium on foundations of probability statistics and statistical theories of science at the University of Western Ontario During the past four decades there have been striking formal advances in our understanding of logic semantics and algebraic structure in probabilistic and statistical theories These advances which include the development of the relations between semantics and metamathematics between logics and algebras and the algebraic geometrical foundations of statistical theories especially in the sciences have led to striking new insights into the formal and conceptual structure of probability and statistical theory and their scientific applications in the form of scientific theory The foundations of statistics are in a state of profound conflict Fisher s objections to some aspects of Neyman Pearson statistics have long been well known More recently the emergence of Bayesian statistics as a radical alternative to standard views has made the conflict especially acute In recent years the response of many practising statisticians to the conflict has been an eclectic approach to statistical inference Many good statisticians have developed a kind of wisdom which enables them to know which problems are most appropriately handled by each of the methods available The search for principles which would explain why each of the methods works where it does and fails where it does offers a fruitful approach to the controversy over foundations [Life Sciences Experiments Performed on Sounding Rockets \(1985-1994\)](#) Augusto Cogoli,Deutsche Agentur für Raumfahrtangelegenheiten,1997 This cooperative ESA DARA volume Life Sciences Experiments Performed on Sounding Rockets 1985 1994 summarises the results of 10 years of European life sciences research under the microgravity conditions provided by sounding rockets Although the TEXUS Sounding Rocket Programme was established by the German Ministry of Research and Technology in 1976 primarily as a preparatory

programme for Spacelab materials and fluid science experiments biologists also became aware of the interesting opportunities after a few flights In 1988 ESA performed the first life sciences experiments within TEXUS beginning an era of successful cooperation ESA then complemented this programme by creating further opportunities for life sciences experiments aboard MASER and MAXUS Sounding rocket activities have become a cornerstone of ESA's current Microgravity Programme EMIR 1 extending into 1997 and its EMIR 2 successor as well as of DARA's Research under Space Conditions programme The investigations summarised in this volume provide clear proof that 6 min of microgravity can yield interesting results in the field of life sciences investigations particularly in gravitational biology and biotechnology This report is not intended as a substitute for the papers that have appeared in the scientific literature but rather as a compilation of the results obtained

The first six chapters of this volume present the author's predictive or information theoretic approach to statistical mechanics in which the basic probability distributions over microstates are obtained as distributions of maximum entropy Le as distributions that are most non committal with regard to missing information among all those satisfying the macroscopically given constraints There is then no need to make additional assumptions of ergodicity or metric transitivity the theory proceeds entirely by inference from macroscopic measurements and the underlying dynamical assumptions Moreover the method of maximizing the entropy is completely general and applies in particular to irreversible processes as well as to reversible ones The next three chapters provide a broader framework at once Bayesian and objective for maximum entropy inference The basic principles of inference including the usual axioms of probability are seen to rest on nothing more than requirements of consistency above all the requirement that in two problems where we have the same information we must assign the same probabilities Thus statistical mechanics is viewed as a branch of a general theory of inference and the latter as an extension of the ordinary logic of consistency Those who are familiar with the literature of statistics and statistical mechanics will recognize in both of these steps a genuine scientific revolution a complete reversal of earlier conceptions and one of no small significance

and objective for maximum entropy inference The basic principles of inference including the usual axioms of probability are seen to rest on nothing more than requirements of consistency above all the requirement that in two problems where we have the same information we must assign the same probabilities Thus statistical mechanics is viewed as a branch of a general theory of inference and the latter as an extension of the ordinary logic of consistency Those who are familiar with the literature of statistics and statistical mechanics will recognize in both of these steps a genuine scientific revolution a complete reversal of earlier conceptions and one of no small significance *Studies of Rocket Noise Simulation with Substitute Gas Jets and the Effect of Vehicle Motion on Jet Noise* Walter V. Morgan, Kenneth J. Young, 1963 The feasibility of using helium jets as a practical substitute for actual rockets in scale model acoustic tests was investigated by conducting an experimental program with four heated helium models Sufficient evidence is presented to indicate that the substitute gas modeling concept is valid i e simulation of rocket noise can be achieved if the essential rocket flow parameters are duplicated It is not possible to duplicate all flow parameters simultaneously and retain the essential feature of simplicity compromises must be made The helium model performed best This evaluation is based on agreement in sound pressure levels with a small solid propellant rocket An investigation was made to determine the effect of flight vehicle motion on propulsion system noise propagated to parts of the vehicle located in the near field Experiments were performed using a 0.6 in diameter heated air jet operating in a 16 in diameter acoustically treated wind tunnel Experimental results compare favorably with predictions based on the hypothesis which explains the effect of vehicle motion by two separate factors the noise produced by a jet in motion depends on the relative velocity between the jet and the air through which it moves and a shifting of the noise radiation pattern toward the rear occurs because of combined effects of vehicle motion and the finite velocity of sound
