

Chapter 1 The Science of Biology**Summary****1-1 What Is Science?**

Science is an organized way of using evidence to learn about the natural world. Scientific thinking usually begins with observation, which is the process of gathering information about events or processes in a careful, orderly way. The information gathered from observations is called data. Quantitative data are expressed as numbers, obtained by counting or measuring. Qualitative data are descriptive and involve characteristics that can't usually be counted. Scientists use data to make inferences. An inference is a logical interpretation based on prior knowledge or experience.

After making first observations, a researcher will propose one or more hypotheses. A hypothesis is a proposed scientific explanation for a set of observations. Scientists generate hypotheses using prior knowledge, logical inference, and informed, creative imagination. Scientific hypotheses must be proposed in a way that enables them to be tested. Hypotheses are tested by performing controlled experiments. The conclusions researchers draw from experiments or data must be valid. To be valid, a conclusion must be based on logical interpretation of reliable data.

1-2 How Scientists Work

Conducting a scientific investigation involves a series of steps. The first step is asking a question. The second step involves forming a hypothesis. The third step in conducting a scientific investigation is setting up a controlled experiment. A hypothesis should be tested by an experiment in which only one variable is changed at a time. All other variables should be kept unchanged. This type of experiment is called a controlled experiment. The variable that is deliberately changed is called the manipulated variable. The variable that is observed and that changes in response

to the manipulated variable is called the responding variable.

The fourth step in conducting a scientific investigation is recording and analyzing results. The fifth step is drawing a conclusion. A key assumption in science is that experimental results can be reproduced.

As evidence builds up, a particular hypothesis may become so well supported that scientists consider it a theory. In science, a theory is a well-tested explanation that unifies a broad range of observations.

1-3 Studying Life

Although living things vary greatly, all living things share eight characteristics:

1. Living things are made up of units called cells. Cells are the smallest units of an organism that can be considered alive.
2. Living things reproduce. In sexual reproduction, cells from two different parents unite to produce the first cell of the new organism. In asexual reproduction, a single cell divides in half to form two new organisms.
3. Living things are based on a universal genetic code. The directions for inheritance are carried by a molecule called DNA.
4. Living things grow and develop. Multicellular organisms typically go through a process called development. As cells divide, they change in shape and structure in a process called differentiation.
5. Living things obtain and use materials and energy. The combination of chemical reactions through which an organism builds up or breaks down materials as it carries out its life processes is called metabolism.

An updated edition of the bestselling text broadens the conception of mindfulness and shows how mindful inquirers can maximize positive outcomes for participants, organizations, communities, and themselves. The first five chapters describe the application of mindful inquiry, and the following nine introduce cultures of inquiry and research traditions, theories, methods, and techniques.

Resources in Education, 1997. *In Mendel's Mirror* Philip Kitcher, 2003-03-27. Philip Kitcher is one of the leading figures in the philosophy of science today. Here he collects for the first time many of his published articles on the philosophy of biology, spanning from the mid 1980s to the present. The book's title refers to Gregor Mendel, an Augustinian monk who was one of the first scientists to develop a theory of heredity. Mendel's work has been deeply influential to our understanding of ourselves and our world, just as the study of genetics today will have a profound and long term impact on future scientific research. Kitcher's articles cover a broad range of topics with similar philosophical and social significance: sociobiology, evolutionary psychology, species, race, altruism, genetic determinism, and the rebirth of creationism in Intelligent Design. Kitcher's work on the intersection of biology and the philosophy of

science is both unprecedented and wide ranging and will appeal not only to philosophers of science but to scholars and students across disciplines

The Nature of Meaningfulness Robert K. Shope, 1999 Shope presents a unified perspective on meaningfulness spanning such varied topics as the meaningfulness of linguistic expressions and conventional signs Freud's conception of the meaningfulness of various mental phenomena and instances of behavior a person's meaning to do something meaning in the arts and even life's having a meaning Shope's perspective is based upon a constitutive analysis of what it is for one item to represent another Criticizing the views of philosophers who attempt to analyze such representing in causal terms or merely in epistemological terms he shows that a successful analysis needs to invoke both types of considerations
