Abstract

This paper describes the design and implementation of a conversion tool. This tool, called Distributed Computing Environment (DCE) Porting Tool, converts an Open Network Computing (ONC) Remote Procedure Call (RPC) application to a DCE RPC application. The manual intervention needed during the conversion process is minimal. The paper briefly describes RPC programming and highlights the difference between ONC RPC and DCE RPC. The design decisions of the Porting Tool is explained. The implementation uses LEX and YACC (language processing tools supported by Unix) for conversion logic and OSF/MOTIF for Graphical User Interface (GUI). The paper concludes with current limitations of the Tool and the possible future work.

1 INTRODUCTION

In simple terms, **Distributed Processing** means that the (individual) components of an application run (execute) on different nodes in a network. The foremost reason for the current popularity of distributed processing is the modular nature of the applications that are being computed. Many of today's high-end applications are inherently distributed. Reasons for the popularity of distributed processing are: high availability of (low cost) computing facilities (such as hardware, software and network components), ability to share the expensive resources over a network, the availability of large computing power of small computers, and inherent fault tolerance associated with the distribution of computing resources.

From the programming point of view, distributed processing can be categorized into various models (Lockhart, 1994). Here we explain the client-server model, used in this paper. For a discussion of other models refer to (Lockhart, 1994).

In the client server model, each interaction is characterized by an asymmetrical relationship between two software processes. One, the client, makes requests for a service, and
