

Fluids and Pressure

BEFORE YOU READ

After you read this section, you should be able to answer these questions:

- What are fluids?
- What is atmospheric pressure?
- What is water pressure?
- What causes fluids to flow?

What Are Fluids?

You have something in common with a dog, a sea gull, and a dolphin. You and all these other animals spend a lifetime moving through fluids. A **fluid** is any material that can flow and that takes the shape of its container. Fluids have these properties because their particles can easily move past each other. Liquids and gases are fluids. 

Fluids produce pressure. **Pressure** is the force exerted on a given area. The motions of the particles in a fluid are what produce pressure. For example, when you pump up a bicycle tire, you push air into the tire. Air is made up of tiny particles that are always moving. When air particles bump into the inside surface of the tire, the particles produce a force on the tire. The force exerted on the area of the tire creates air pressure inside the tire.

The air particles inside the tire hit the walls of the tire with a force. This force produces a pressure inside the tire. The pressure keeps the tire inflated.

PRESSURE AND BUBBLES

Why are bubbles round? It's because fluids (such as the gas inside the bubbles) exert the same pressure in all directions. This gives the bubbles their round shape.

STUDY TIP

Explain As you read this section, study each figure. In your notebook, describe what each figure tells you about pressure.

Intracranial Pressure and Neuromonitoring XVII Bart Depreitere, Geert Meyfroidt, Fabian Güiza, 2021-04-10 This book gathers the proceedings of the 17th International Conference on Intracranial Pressure and Neuromonitoring held in Leuven Belgium in September 2019. It provides an overview of the current understanding underlying research and future perspectives concerning pathophysiology, biophysics, monitoring and management in traumatic and non-traumatic acute brain injury, hydrocephalus and spinal cord injury, including cerebrovascular autoregulation impairment in neurological as well as non-neurological diseases. The peer-reviewed contributions were prepared by specialists in neurosurgery, neurointensive care and neuroanesthesiology as well as prominent experts from the fields of physiology, clinical and biomedical engineering, mathematics and informatics. The book continues the time-honored tradition of publishing key presentations from the ICP Conferences in order to facilitate their dissemination within the clinical and research community. **Official Gazette of the United States Patent and Trademark Office**, 1999 **Practical Engineer**, 1909 **Official Gazette of the United States Patent Office**, 1910 **Official Gazette of the United States Patent Office**, 1910 Groundwater-induced geological disasters in underground engineering: Theoretical, experimental, and numerical approaches Shengli Yang, Liang Chen, Danqi Li, 2023-12-21 Water inrush (WI) is one of the most dangerous geological disasters in underground engineering with significant human casualties and economic losses. To prevent and control WI disasters, great efforts have been made to address WI mechanisms for more than half a century. In particular, the seepage instability theory is hitherto one of the most widely used theoretical models. This theory portrays that the seepage system will undergo structural instability when the initial values of permeability and boundary pressure meet certain conditions, which manifests that the permeability parameter is one of the most valuable indicators to unveil WI mechanisms. However, rock permeability is determined by its internal structural characteristics, which can be affected by water, chemical composition, stress, environment and temperature. In this regard, it is of great necessity and importance to facilitate a better understanding of the holistic impacts of multi-field coupling on rock internal structure and deformation failure characteristics. This Research Topic aims to initiate a global forum for presenting and disseminating the latest advancements of WI mechanisms, which entails the characterization of physical and laboratory tests, 3D reconstruction of rock internal structure, numerical approaches, theoretical models, under multi-field coupling and field data analysis methods. *Mesothelial Physiology and Pathophysiology* Sotirios G. Zarogiannis, 2018-11-02 The mesothelium is composed by a single layer of mesothelial cells that vest the serosal cavities: pleural, peritoneal and pericardial and internal organs of the body. The mesothelial cells have a mixed phenotype of epithelial cells and fibroblasts, rendering them remarkable plasticity. Besides providing a slippery surface for the frictionless movement of internal organs, the mesothelium participates in a wide range of physiological and pathophysiological processes. Some of its functions include lung development, trans-cellular and para-

cellular transport of ions and water secretion of glycoproteins mainly hyaluronan secretion of cytokines and growth factors wound healing response to inflammatory stimuli and induction of inflammation mesothelial to mesenchymal transition and formation of tunneling nanotubes Many of these functions are pivotal to physiological conditions such as respiratory development maintenance of steady volume of serosal fluids and serosal permeability cell to cell communication re mesotheliazation of serosal membranes after mechanical e g by asbestos or nanoparticles or inflammatory injury and participation in immune responses Deviation from the physiological threshold of these functions results in the development of serosal effusions induction of serosal and lung fibrosis induction of mesothelial tumorigenesis leading thus to devastating pathologies Treatment of pathologies like mesothelioma pleural and peritoneal fibrosis in cases of patients under Peritoneal Dialysis or lung fibrosis still pose a great challenge for researchers
