Adding a normally functioning copy of a mutated gene to help affected cells, tissues and organs work properly.

2. What are the five criteria for a gene therapy candidate disease?

- 1. The condition must result from mutations in one or more genes.*
- 2. You must know which gene is involved and have an available DNA copy of that gene.*
- 3. You must know the biology of the disorder - which tissue is affected, the role of the protein encoded by the gene, and how mutations in the gene affect the protein product.*
- 4. Adding a normal copy of the gene must fix the problem.*

Targeting the right cells, activating the gene, integrating the gene into the cells, avoiding harmful side effects.

5. Explain the *in vivo* technique of delivering genes to a patient's cells.

*The vector carrying the gene is injected directly into the body. The *in vivo* approach happens inside the body.*

The Ethics of Human Gene Therapy LeRoy Walters,Julie Gage Palmer,1997 The authors of this absorbing new book describe the science of gene therapy in terms easily accessible to the non specialist and focus on the controversial ethical and public policy issues surrounding human interventions in human heredity After a brief survey of the structure and functions of DNA genes and cells Walters and Palmer discuss three major types of potential genetic intervention somatic cell gene therapy germ line gene therapy and genetic enhancements They start with the current techniques of gene addition using non reproductive somatic cells in an effort to cure or treat disease Next they address the technical problems and moral issues facing attempts to prevent disease through genetically modifying early human embryos or sperm and egg cells These changes would be passed on to future generations Chapter 4 in many ways the most original part of this volume confronts the issue of employing genetic means to improve human abilities and appearance Depending on the techniques employed such enhancements could affect not only the individuals receiving the intervention but their offspring as well Three types of genetic enhancements are considered physical alterations to improve size reduce the need for sleep and decelerate aging intellectual enhancements of memory and general cognitive ability and moral enhancements for control of violently aggressive behavior The authors maintain that genetic modifications should be evaluated individually rather than be condemned in principle or as a group The final chapter summarizes the public review process that human gene therapy proposals have been undergoing in the United States since 1990 Five appendices providing technical background information along with a complete list of questions raised in the national public review process supplement the discussion

Gene Therapy for the Central and Peripheral Nervous System Andrew P. Tosolini, George M. Smith, 2018-05-10 Gene therapy is at the forefront of current techniques that aim to re establish functional connectivity after an insult to the brain spinal cord or peripheral nerves Gene therapy makes the most of the existing cellular machinery and anatomical networks to facilitate molecular changes in DNA RNA and proteins aiming to repair these disrupted connections For instance gene therapy is currently being used to target genes in conditions including spinal cord injury amyotrophic lateral sclerosis spinal muscular atrophy stroke and multiple sclerosis amongst others The various delivery routes include viral vectors genetically modified cellular implants naked DNA RNA liposomes Cre LoX recombination optogenetics and nanoparticles In particular gene therapy aims to restore function by augmenting the expression of neuroprotective axonal growth promoting neurotrophic factors e g BDNF CNTF NGF and GDNF etc Furthermore the downstream intracellular signalling pathways after receptor activation can also be targeted e g mTor MAPK etc On the other hand gene therapy can also be used to downregulate and or remove faulty mutated genes such as those contributing to disease progression or that inhibit axonal regeneration e g SOD 1 TDP 43 Nogo A MAG OmGP etc Depending on the methodology these genes for instance can be silenced removed or replaced to alleviate the underlying pathology As such gene therapy can transform a largely toxic and inhibitory milieu surrounding a neuronal axonal insult into a growth permissive environment that will ultimately aid neuronal survival and functional regeneration Moreover gene therapy has the capacity to target non neuronal cells and can be even used for neuroanatomical tract tracing Ultimately the principal outcome of gene therapy is to functionally restore damaged neuronal and or axonal connections irrespective of the system it is being introduced in To This Research Topic is devoted to work using gene therapy for the both the central and or peripheral nervous system

Introduction to Genetics Terry A. Brown, 2025-02-18 Nowadays genetics focuses on DNA Just like the first edition the theme of this new edition Introduction to Genetics A Molecular Approach is therefore the progression from molecules DNA and genes to processes gene expression and DNA replication to systems cells organisms and populations This progression reflects both the basic logic of life and the way in which modern biological research is
