

EARTH'S CHANGING Surface

After sailing through space for nine and a half years, the spacecraft, *New Horizons*, reaches its destination. It prepares for the work it begins to snap photos of the new world. The tiny planet is so cold that nitrogen gas solidifies into multiple structures, which are made of rock, ice, and gas, and will be compressed into the new world. Unusually, the spacecraft detects evidence of a subsurface ocean beneath miles of frozen ground. Science fiction? These images describe the flyby of the *New Horizons* space probe past the dwarf planet Pluto in 2015.

Pluto is so far from the Sun that its average surface temperature is -226°C (-375°F). Its strange landscape is composed of materials that are typically liquid or gas on Earth. By understanding how the rocky surface of our own home planet is shaped, scientists can identify geological patterns. This allows experts to make informed predictions about the terrain of Pluto and other planets. We can do this, too, by studying maps and aerial photos of the two planets.

One observation is the lack of craters over large areas of Pluto. All planets and moons are struck with space rocks. Our own Earth has perfect impact sites scattered all over the surface. Examples include the Meteor Crater in Arizona, the Meteor Lake Crater in India, and the Vredefort Crater in South Africa. These craters vary in size, location, and size but show the impact of meteorites on the surface of a planet.

Photos of Pluto show large mountains with peaks that sit at the center of the moon. This is a bell-shaped volcano. Pluto's mountains are called the "Troy mountains" give off light, heat, ammonia, and methane gas. On Earth, active volcanoes show volcanoes with the typical shape. Some of the craters in the surface are caused by tectonic plate movement (volcanoes), which happens very slowly.

When we compare geological processes on Earth to those on Pluto, we also notice some striking differences. One feature unique to Pluto is the presence of blade-shaped mountains. Experts believe these tall structures are made of methane ice, which does not normally exist on Earth. Mountains formed on Earth come about in a similar way to volcanoes: the movement and pushing of tectonic plates.

Geological processes change the surface of Earth and other planets quickly and slowly and in big and small ways. Look for evidence of such changes near you!
