Rock • Paper • Pixels Patrick Aievoli, 2025-01-20. The purpose of this book is to avail faculty and students of the many different innovations, events, effects, and back stories equated with the advent of this new era of communications and its impact on our world. At our core, we are a species that needs to communicate and to find a way to properly represent those messages. Since the beginning of recorded history, mankind has always attempted to communicate and to keep track of its endeavors and accomplishments. Now, by using interaction design and modern digital media, it has become possible to present our story through many current and evocative platforms. As each generation comes of age, this new method is being utilized in all areas of their communication choices. These new generations desire their communication at a different rate than its predecessors. They want their information Internet ready and interactive. They are involved in the immediate, and that choice is not going away. Interactive media is here to stay and has new rules and new effects. It is changing our economies, our societies, and especially us as individuals. The main goal of this book is to help you see how it started, where it is going, and how to be on the right side of this transformation. How to take your first steps in that new direction and how to understand the effects of this new form of communication while being aware of its abilities and its dangers. As a friend once said, no matter how thin you slice it, there are always two sides. **Educating for the 21st**

Hierarchical Object Representations in the Visual Cortex and Computer Vision Antonio Rodríguez-Sánchez, Mazyar Fallah, Ales Leonardis, 2016-06-08 Over the past 40 years neurobiology and computational neuroscience has proved that deeper understanding of visual processes in humans and non human primates can lead to important advancements in computational perception theories and systems One of the main difficulties that arises when designing automatic vision systems is developing a mechanism that can recognize or simply find an object when faced with all the possible variations that may occur in a natural scene with the ease of the primate visual system The area of the brain in primates that is dedicated at analyzing visual information is the visual cortex The visual cortex performs a wide variety of complex tasks by means of simple operations These seemingly simple operations are applied to several layers of neurons organized into a hierarchy the layers representing increasingly complex abstract intermediate processing stages In this

Research Topic we propose to bring together current efforts in neurophysiology and computer vision in order 1 To understand how the visual cortex encodes an object from a starting point where neurons respond to lines bars or edges to the representation of an object at the top of the hierarchy that is invariant to illumination size location viewpoint rotation and robust to occlusions and clutter and 2 How the design of automatic vision systems benefit from that knowledge to get closer to human accuracy efficiency and robustness to variations
