

PHOTOSYNTHESIS

Complex series of reactions that takes place in two stages:
 1. **Light reaction** (light dependent)
 2. **The Calvin cycle - Carbon Fixation** (Light independent)

The nature of light

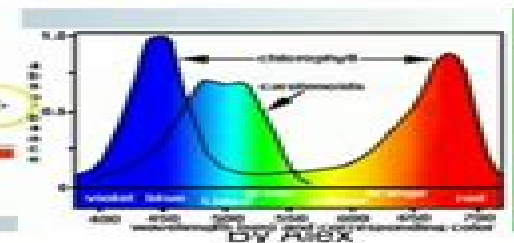

- Light is energy emitted as photons which acts both particle and waves
- Different wavelength of light carry different amount of energy
- The shorter the wavelength, the higher the energy
- Different wavelength = different color
- Sunlight is a mixture of different wavelength:

ROYGBIV

Longer	←	Wavelength	→	shorter
Lower	←	Frequency	→	higher
Lower	←	Energy	→	higher

When the sunlight hit the plant, the energy is absorbed by the pigments. Different pigments absorb different wavelength. If the wavelength not absorbed, it is reflected.

Chlorophyll is the major photosynthetic pigment. It is absorbing some wavelength but reflecting **green**.

genome editing reagents and plant regeneration system has often been both crop specific and crop limited Recent progress using morphogenic genes such as Wuschel2 Wus2 and Babyboom Bbm has alleviated some of these crop specific challenges and along with other improvements continues to expand the range of plants that can be edited
