

The following program demonstrates the use of #define and const –

```
#include<iostream>
using namespace std;
#define PI 3.142
const int MAX=5;
int main ()
{
    float radius, area;
    cout<<"Enter the radius :";
    cin>> radius;
    area=PI*radius*radius;
    cout<< "Area of the circle = "<<area <<"\n";
    cout<<"constant max value is: "<<MAX<<endl;
    // PI=3; //Invalid
    // MAX=10; //error: assignment of read-only variable 'MAX'
}
```

In the above program the statement

```
area = PI * radius * radius;
```

is translated by the preprocessor as

```
area = 3.142 * radius * radius;
```

and calculated result is stored in the variable 'area' which is displayed in the next statement.

MAX variable contains the constant value 5 and same is displayed.

- c) **The main keyword:** It is explained earlier in the user-defined data type section.

Operators

An operator is a symbol that tells the compiler to perform specific mathematical or logical manipulations. All C operators are valid in C++. The detailed description is provided in separate document for C operators for ease of reading. All the codes should be experimented by students using C++ syntax. Following operators other than >> and << are available in C++:

::	Scope resolution operator
::*	Pointer-to-member declarator
->*	Pointer-to-member operator
.*	Pointer-to-member operator
delete	Memory release operator
endl	Line feed operator
new	Memory allocation operator
setw	Field width operator

Typcasting

Typcasting is the concept of converting the value of one type into another type. For example, you might have a float that you need to use in a function that requires an integer.

- **Implicit conversion:** Almost every compiler makes use of what is called automatic typcasting. It automatically converts one type into another type. If the compiler converts a type it will normally give a warning. For example this warning: conversion from "double" to "int", possible loss of data. The problem with this is, that you get a warning (normally you
