

A GUIDE TO ^{13}C NMR CHEMICAL SHIFT VALUES

Nuclear Magnetic Resonance (NMR) is a commonly used technique for organic compound structure determination. In ^{13}C NMR, applying an external magnetic field causes the nuclei spin to flip. The environment of the carbon atom in the molecule affects where the signal is seen on the resultant spectrum.

^{12}C 99% ^{13}C 1%

Only 1% of carbon atoms are carbon-13, atoms which have one more neutron than carbon-12. NMR doesn't work for carbon-12, as its nucleus doesn't have a 'spin'. The frequency required to 'flip' a carbon-13 nucleus is around a quarter of that required to flip an hydrogen nucleus in ^1H -NMR. As the probability of two adjacent carbons in a single molecule being carbon-13 atoms is very low, no splitting of peaks is seen, unlike in ^1H -NMR.

Analysis of NMR Spectra R. A. Hoffman, S. Forsen, B. Gestblom, 2012-12-06 Nuclear magnetic resonance spectroscopy which has evolved only within the last 20 years has become one of the very important tools in chemistry and physics The literature on its theory and application has grown immensely and a comprehensive and adequate treatment of all branches by one author or even by several becomes increasingly difficult This series is planned to present articles written by experts working in various fields of nuclear magnetic resonance spectroscopy and will contain review articles as well as progress reports and original work Its main aim however is to fill a gap existing in literature by publishing articles written by specialists which take the reader from the introductory stage to the latest development in the field The editors are grateful to the authors for the time and effort spent in writing the articles and for their invaluable cooperation The Editors Analysis of NMR Spectra A Guide for Chemists R A HOFFMAN t S FORSEN Division of Physical Chemistry Chemical Center Lund Institute of Technology Lund Sweden B GESTBLOM Institute of Physics University of Uppsala Sweden Contents I Principles of NMR Spectroscopy 4 1 1 The Magnetic Resonance Phenomenon 4 a Nuclear Moments 4 b Magnetic Spin States and Energy Levels 5 c The Magnetic Resonance Condition 7 d The Larmor Precession 7 e Experimental Aspects 8 1 2 Chemical Shifts 9 a The Screening Constant 11 9 b Chemical Shift Scales 11 and r 10 1 3 Spin Coupling Constants 12 1 4 Intensities

Nuclear magnetic resonance NMR spectroscopy is one of the most powerful and widely used techniques in chemical research for investigating structures and dynamics of molecules Advanced methods can even be utilized for structure determinations of biopolymers for example proteins or nucleic acids NMR is also used in medicine for magnetic resonance imaging MRI The method is based on spectral lines of different atomic nuclei that are excited when a strong magnetic field and a radiofrequency transmitter are applied The method is very sensitive to the features of molecular structure because also the neighboring atoms influence the signals from individual nuclei and this is important for determining the 3D structure of molecules This new edition of the popular classic has a clear style and a highly practical mostly non mathematical approach Many examples are taken from organic and organometallic chemistry making this book an invaluable guide to undergraduate and graduate students of organic chemistry biochemistry spectroscopy or physical chemistry and to researchers using this well established and extremely important technique Problems and solutions are included MODERN NMR SPECTROSCOPY: A GUIDE FOR CHEMISTS Jeremy K. Alternative Refrigerants Thomas J. Bruno, 2019-07-23 Many laboratories are engaged in research on the development of new fluids for use as refrigerants to replace the fully halogenated materials that are believed to contribute to atmospheric ozone depletion. An integral part of this effort is the chemical analysis of new fluids that are synthesized, prepared and tested. This comprehensive book, which is divided into two parts, fills an important need in this vital chemical analysis protocol. The first part reviews the major chemical analysis methods that have been developed and used at NIST and in other laboratories. This review covers spectroscopic, chromatographic and wet analytical methods with treatment divided by qualitative identification, qualitative determinations and chemical reaction screening. The second part contains a compilation of analytical information of the new fluids and their products. Physical properties, mass spectra, infrared spectra, ultraviolet spectra, nuclear magnetic resonance spectra and gas chromatographic retention data are provided for each fluid or product.
