[Constants](#) | [Periodic Table](#)

Learning Goal:

To understand how the trajectory of an object depends on its initial velocity, and to understand how air resistance affects the trajectory.

For this problem, use the PhET simulation *Projectile Motion*. This simulation allows you to fire an object from a cannon, see its trajectory, and measure its height, range, and hang time (the amount of time in the air).

Start the simulation by selecting the option labeled "Intro". Press the red **Fire** icon to launch an object. You can choose the object by clicking on one of the objects in the scroll-down menu at top right. To adjust the cannon barrel's angle, click and drag on it. You can also adjust the **Initial Speed** of the object using the toolbar at the bottom left. Clicking **Air Resistance** displays the drag coefficient for the given object and enables air resistance during motion. To measure the height, range, or hang time, drag the box that contains these quantities from the top of the screen to the various points of interest along the object's trajectory (use the crosshairs to locate the exact point of interest).

Play around with the simulation. When you are done, click the **Erase** icon and set the object to a pumpkin prior to beginning Part A. For now leave **Air Resistance** unchecked.

Part A

First, you will investigate purely vertical motion. The kinematics equation for vertical motion (ignoring air resistance) is given by
