The Estimation and Evaluation of Optimal Thresholds for Two Sequential Testing Strategies Amber R. Wilk, 2013 Many continuous medical tests often rely on a threshold for diagnosis There are two sequential testing strategies of interest Believe the Positive BP and Believe the Negative BN BP classifies a patient positive if either the first test is greater than a threshold θ_1 or negative on the first test and greater than θ_2 on the second test BN classifies a patient positive if the first test

is greater than a threshold θ_3 and greater than θ_4 on the second test Threshold pairs θ_1 θ_2 or θ_3 θ_4 depending on strategy are defined as optimal if they maximized GYI Se r Sp 1 Of interest is to determine if these optimal threshold or optimal operating point OOP estimates are good when calculated from a sample The methods proposed in this dissertation derive formulae to estimate θ assuming tests follow a binormal distribution using the Newton Raphson algorithm with ridging A simulation study is performed assessing bias root mean square error percentage of over estimation of Se Sp and coverage of simultaneous confidence intervals and confidence regions for sets of population parameters and sample sizes Additionally OOPs are compared to the traditional empirical approach estimates Bootstrapping is used to estimate the variance of each optimal threshold pair estimate The study shows that parameters such as the area under the curve ratio of standard deviations of disease classification groups within tests correlation between tests within a disease classification total sample size and allocation of sample size to each disease classification group were all influential on OOP estimation Additionally the study shows that this method is an improvement over the empirical estimate Equations for researchers to use in estimating total sample size and SCI width are also developed Although the models did not produce high coefficients of determination they are a good starting point for researchers when designing a study A pancreatic cancer dataset is used to illustrate the OOP estimation methodology for sequential tests
