

The Earth's Interior

The Earth's interior is made up of four layers (see diagram below)...

- **Crust:** Solid, outer layer of the Earth
- **Mantle:** Part solid, part melted layer beneath the crust
- **Outer Core:** Melted, metallic layer beneath the mantle
- **Inner Core:** Solid, metallic layer beneath the outer core

The outer-most part of the **mantle** is completely solid and is called the **rigid mantle**. The **rigid mantle** and the crust together make up the **lithosphere**. This solid **lithosphere** "floats" upon the melted part of the **mantle** beneath. This melted part of the **mantle** is called the **asthenosphere**. It is not completely melted into a liquid, it is thick and gooey, like chewed up bubble gum. We refer to this gooey asthenosphere as **plastic**.

Manning,Jung-Fu Lin,Wendy L. Mao,2020-04-03 Carbon in

Earth's fluid envelopes the atmosphere, biosphere, and hydrosphere, playing a fundamental role in our planet's climate system and a central role in biology, the environment, and the economy of the earth system. The source and original quantity of carbon in our planet is uncertain, as are the identities and relative importance of early chemical processes associated with planetary differentiation. Numerous lines of evidence point to the early and continuing exchange of substantial carbon between Earth's surface and its interior, including diamonds, carbon-rich mantle-derived magmas, carbonate rocks in subduction zones, and springs carrying deeply sourced carbon-bearing gases. Thus, there is little doubt that a substantial amount of carbon resides in our planet's interior. Yet, while we know it must be present, carbon's forms, transformations, and movements at conditions relevant to the interiors of Earth and other planets remain uncertain and untapped. Volume highlights include:

- Reviews:** key general topics such as carbonate minerals, the deep carbon cycle, and carbon in magmas or fluids.
- Describes:** new results at the frontiers of the field with presenting results on carbon in minerals, melts, and fluids at extreme conditions of planetary interiors.
- Brings together:** emerging insights into carbon's forms, transformations, and movements through study of the dynamics, structure, stability, and reactivity of carbon-based natural materials.
- Reviews:** emerging new insights into the properties of allied substances that carry carbon, into the rates of chemical and physical transformations, and into the complex interactions between moving fluids, magmas, and rocks to the interiors of Earth and other planets.
- Spans:** the various chemical redox states of carbon, from reduced hydrocarbons to zero-valent diamond and graphite to oxidized CO₂ and carbonates.
- Captures and synthesizes:** the exciting results of recent focused efforts in an emerging scientific discipline.
- Reports:** advances over the last decade that have led to a major leap forward in our understanding of carbon science.
- Compiles:** the range of methods that can be tapped, from the deep carbon community, which includes experimentalists, first-principles theorists, thermodynamic modelers, and geodynamicists.
- Represents:** a reference point for future deep carbon science research.

Carbon in Planetary Interiors will be a valuable resource for researchers and students who study the Earth's interior. The topics of this volume are interdisciplinary and therefore will be useful to professionals from a wide variety of fields in the Earth Sciences, such as mineral physics, petrology, geochemistry, experimentalists, first-principles theorists, thermodynamics, material science, chemistry, geophysics, and geodynamics.
