Yussen,M Cecil Smith,2012-12-06 One of the liveliest areas of research in the social sciences is reading Scholarly activity is currently proceeding along a number of different disciplinary lines addressing a multitude of questions and issues about reading A short list of disciplines involved in the study of reading would include linguistics psychology education history and gerontology Among the important questions being addressed are some long standing concerns How are reading skills acquired What are the basic components of reading skill How do skilled readers differ from less skilled ones What are the best ways to approach instruction for different groups of readers young beginning readers poor readers with learning problems and teenage and adult illiterates How can reading skill best be measured what standardized instruments and observational techniques are most useful The large volume of textbooks and scholarly books that issue forth each year is clear evidence of the dynamic nature of the field The purpose of this volume is to survey some of the best work going on in the field today and reflect what we know about reading as it unfolds across the life span Reading is clearly an activity that spans each of our lives Yet most accounts of it focus on some narrow period of development and fail to consider the range of questions that serious scholarship needs to address for us to have a richer understanding of reading The book is divided into four parts

**Abstract Mathematical Cognition** Wolfgang Grodd,Philippe Chassy,2016-08-09 Despite the importance of mathematics in our educational systems little is known about how abstract mathematical thinking emerges Under the uniting thread of mathematical development we hope to connect researchers from various backgrounds to provide an integrated view of abstract mathematical cognition Much progress has been made in the last 20 years on how numeracy is acquired Experimental psychology has brought to light the fact that numerical cognition stems from spatial cognition The findings from neuroimaging and single cell recording experiments converge to show that numerical representations take place in the intraparietal sulcus Further research has demonstrated that supplementary neural networks might be recruited to carry out subtasks for example the retrieval of arithmetic facts is done by the angular gyrus Now that the neural networks in charge of basic mathematical cognition are identified we can move onto the stage where we seek to understand how these basics skills are used to support the acquisition and use of abstract mathematical concepts From Ratios to Decimals Andrea Marie
