subjects *Gorenstein Liaison, Complete Intersection Liaison Invariants and Unobstructedness* Jan Oddvar Kleppe, 2001
 This paper contributes to the liaison and obstruction theory of subschemes in $\mathbb{P}^n$ having codimension at least three
 The first part establishes several basic results on Gorenstein liaison A classical result of Gaeta on liaison classes of
 projectively normal curves in $\mathbb{P}^3$ is generalized to the statement that every codimension c standard determinantal
 scheme is a scheme defined by the maximal minors of a $t \times (t - c + 1)$ homogeneous matrix is in the Gorenstein liaison class of
 a complete intersection Then Gorenstein liaison theory is developed as a theory of generalized divisors on
 arithmetically Cohen Macaulay schemes In particular a rather general construction of basic double G linkage is introduced
 which preserves the even G liaison class This construction extends the notion of basic double linkage which plays a
 fundamental role in the codimension two situation The second part of the paper studies groups which are invariant under
 complete intersection linkage and gives a number of geometric applications of these invariants Several differences between
 Gorenstein and complete intersection liaison are highlighted For example it turns out that linearly equivalent divisors on a
 smooth arithmetically Cohen Macaulay subscheme belong in general to different complete intersection liaison classes but
 they are always contained in the same even Gorenstein liaison class The third part develops the interplay between liaison
 theory and obstruction theory and includes dimension estimates of various Hilbert schemes For example it is shown that
 most standard determinantal subschemes of codimension 3 are unobstructed and the dimensions of their components in the
 corresponding Hilbert schemes are computed Oswaal CAT 15 Mock Test Papers for 2024 Exam Oswaal Editorial
