Layers of the Atmosphere: An Exploration

The Earth's atmosphere is divided into five layers, each with unique characteristics. Understanding these layers is essential for grasping how our planet's environment works.

Troposphere: The lowest layer, extending from the surface up to about 10-12 km. It's where most weather occurs, and temperature decreases as altitude increases.

Stratosphere: The layer above the troposphere, extending up to about 50 km. Temperature increases with altitude due to the presence of the ozone layer, which absorbs harmful ultraviolet radiation.

Mesosphere: The layer above the stratosphere, extending up to about 85 km. Temperature decreases with altitude, and it's where many meteors burn up.

Thermosphere: The layer above the mesosphere, extending up to about 600 km. Temperature increases significantly with altitude due to the absorption of high-energy solar radiation.

Exosphere: The outermost layer, extending from the top of the thermosphere into space. It's the least dense layer and contains very few molecules.
