1. cholesterol, proteins, and carbohydrates
2. A phospholipid is a molecule that has a glycerol backbone, two fatty acid chains, and a phosphate-containing compound. The plasma membrane is made of two layers of phospholipids that are arranged tail-to-tail.
3. The primary function of the plasma membrane is to maintain homeostasis by providing a thin, flexible boundary between a cell and its watery environment. The plasma membrane allows nutrients to enter the cell and allows waste and other products to leave the cell.
4. If the plasma membrane of a cell lost its selective permeability, it would no longer be able to control the movement of substances in and out of the cell. Waste products might build up inside the cell, the cell might not be able to take in nutrients, and the cell might take in excess water or harmful substances from its environment.

5. The surface of the plasma membrane can be described as a mosaic because different substances float around within the plasma membrane, creating a pattern on the membrane's surface.
