

## Chapter 21: Electromagnetism

### Section 21.2 Electromagnetism

#### Learning Objectives

After completing this chapter, you should be able to:

- Explain the relationship between electric and magnetic fields.
- Describe the forces between two parallel wires carrying current.
- Explain the operation of a transformer.

#### Reading Strategy (page 10)

Read the chapter carefully, paying attention to the examples and diagrams. Try to understand the concepts and the relationships between them. If you have any questions, ask your teacher or a friend. The chapter is divided into sections, each dealing with a different aspect of electromagnetism.

Topic	Summary
Electric and magnetic fields	Electric and magnetic fields are vector quantities. They are produced by electric charges and currents. They interact with each other and with matter. The relationship between them is described by Maxwell's equations.
Forces between parallel wires	Two parallel wires carrying current in the same direction attract each other. If the currents are in opposite directions, the wires repel each other. The force is proportional to the product of the currents and the length of the wires.
Transformers	A transformer is a device that transfers electrical energy from one circuit to another through a magnetic field. It consists of two coils of wire wound around a common iron core. The primary coil is connected to an AC source, and the secondary coil is connected to a load.
Electromagnetic induction	Electromagnetic induction is the process by which a changing magnetic field induces an electromotive force (EMF) in a conductor. This is the principle behind the operation of a generator and a transformer.
Electromagnetic waves	Electromagnetic waves are waves that consist of oscillating electric and magnetic fields. They travel through space at the speed of light. Examples include radio waves, visible light, and X-rays.
