

## PreAP Circuits 5

1. After working the circuit at the right (meaning do all your work on the diagram first), answer the following.

- \* Calculate the current flowing thru the circuit.
- How much current is flowing thru the  $100\Omega$  resistor?
- \* How much voltage is used by the  $100\Omega$  resistor?
- \* How much power is used by the  $100\Omega$  resistor?
- Calculate how much voltage is left at point E.
- \* On the diagram, calculate the voltage used by the other two resistors.
- How does the voltage drop across  $R_1$  compare with  $R_2$ ?
- How does the resistance of  $R_1$  compare with  $R_2$ ?
- How does the voltage drop across  $R_2$  compare with  $R_1$ ?
- How does the resistance of  $R_2$  compare with  $R_1$ ?
- Using the  $V_{total}$  and  $I_{total}$ , calculate  $P_{total}$  for the whole circuit.
- If one of the resistors was replaced by a wire, how would the current change (increase, decrease, stay the same)?
- If a third battery was added to the circuit, how would the current change?

2. Now, using what you learned from parts G-I above (and the lab),

- How much voltage is used by the  $150\Omega$ ?
- What is the voltage of the battery?
- \* How much current is flowing (in mA)?

- The new symbol you see in the diagram at the left is a multicell battery (like a 9V), which is made up of a number of smaller single cell batteries (like a 1.5V). Let's say its total voltage is V.
  - Which resistor takes the most voltage?
  - What is the total resistance?
  - In variables, what is the current in the circuit?
  - How does the voltage used by the  $2R$  compare with  $R$ ?
  - In variables, what is the voltage used by the  $2R$  resistor?

In the diagram at the left you will need to decide which switches to close to allow different resistors to have current flowing thru them. This is like maze games—just follow the path. But here are the rules: 1) you must start at the + side of the battery (big side) and get back to the - side; 2) you can't go backwards along the same line (since current only flows from high V to low V); 3) you can't make a short-circuit (make a circuit without a resistor in it).

- So, which switches need to be closed to allow:
  - \* only resistor 1 to have current in it?
  - only resistor 2 to have current thru it?
  - to by-pass both resistors?
  - for electricity to go thru both resistors?
