Multivariable Calculus **Systolic Geometry and Topology** Mikhail Gersh Katz, 2007 The systole of a compact metric space X is a metric invariant of X defined as the least length of a noncontractible loop in X When X is a graph the invariant is usually referred to as the girth ever since the 1947 article by W Tutte The first nontrivial results for systoles of surfaces are the two classical inequalities of C Loewner and P Pu relying on integral geometric identities in the case of the two

dimensional torus and real projective plane respectively Currently systolic geometry is a rapidly developing field which studies systolic invariants in their relation to other geometric invariants of a manifold This book presents the systolic geometry of manifolds and polyhedra starting with the two classical inequalities and then proceeding to recent results including a proof of M Gromov's filling area conjecture in a hyperelliptic setting It then presents Gromov's inequalities and their generalisations as well as asymptotic phenomena for systoles of surfaces of large genus revealing a link both to ergodic theory and to properties of congruence subgroups of arithmetic groups The author includes results on the systolic manifestations of Massey products as well as of the classical Lusternik Schnirelmann category

Hessian Polyhedra, Invariant Theory And Appell Hypergeometric Functions Lei Yang, 2018-03-13 Our book gives the complex counterpart of Klein's classic book on the icosahedron We show that the following four apparently disjoint theories the symmetries of the Hessian polyhedra geometry the resolution of some system of algebraic equations algebra the system of partial differential equations of Appell hypergeometric functions analysis and the modular equation of Picard modular functions arithmetic are in fact dominated by the structure of a single object the Hessian group G_{216} It provides another beautiful example on the fundamental unity of mathematics
