Landsberg,2024-06-28 This book presents the basics of quantum computing and quantum information theory It emphasizes the mathematical aspects and the historical continuity of both algorithms and information theory when passing from classical to quantum settings The book begins with several classical algorithms relevant for quantum computing and of interest in their own right The postulates of quantum mechanics are then presented as a generalization of classical probability Complete rigorous and self contained treatments of the algorithms of Shor Simon and Grover are given Passing to quantum information theory the author presents it as a straightforward adaptation of Shannon s foundations to information theory Both Shannon s theory and its adaptation to the quantum setting are explained in detail The book concludes with a chapter on the use of representation theory in quantum information theory It shows how all known entropy inequalities including the celebrated strong subadditivity of von Neumann entropy may be obtained from a representation theory perspective With many exercises in each chapter the book is designed to be used as a textbook for a course in quantum computing and quantum information

Robustness in Identification and Control M. Milanese,2013-06-29 This volume collects most of the papers presented at the International Workshop on Robustness in Identification and Control held in Torino Italy in 1988 The main focal point of the workshop was Unknown But Bounded uncertainty and associated robustness issues in identification and control Recent years have seen a growing interest in studying models which include un known but bounded uncertainty The motivation for dealing with such models is derived from robustness considerations In many applications some performance specification must be met for all admissible variations of the uncertain parameters A second motivation for models with this type of uncertainty stems from the fact that the statistical description of uncertain variables may not be well known or even not suitable For example in some cases only a small number of measurements is available and the resulting errors are due to analog digital conversion modelling ap proximation or round off so that a statistical description may actually be unreliable The interest in unknown but bounded setting is certainly not new In fact engineering practice demands for appropriate algorithms in dealing with finite sample properties finite parameter variations tolerance analysis etc Despite the natural need for such methods the lack of sufficiently well assessed theoretical results and algorithms prevented a systematic use of these procedures until recent years How ever in the last few years important advances have been made both in estimation theory and in stability analysis

Plane Answers to Complex Questions Ronald Christensen,2013-03-09 The third edition of Plane Answers includes fundamental changes in how some aspects of the theory are handled Chapter 1 includes a new section that introduces generalized linear models Primarily this provides a definition so as to allow comments on how aspects of linear model theory extend to generalized linear models For years I have been unhappy with the concept of estimability Just because you cannot get a linear unbiased estimate of something does not mean you cannot estimate it For example it is obvious how to estimate the ratio of two contrasts in an ANOVA just estimate each one and take their ratio The real issue is that if the model matrix X is not of full rank the parameters are not identifiable Section 2.1 now introduces the concept of identifiability and treats estimability as a special case of identifiability This change also resulted in some minor changes in Section 2.2 In the second edition Appendix F presented an alternative approach to dealing with linear parametric constraints In this edition I have used the new approach in Section 3.3 I think that both the new approach and the old approach have virtues so I have left a fair amount of the old approach intact Chapter 8 contains a new section with a theoretical discussion of models for factorial treatment structures and the introduction of special models for homologous factors This is closely related to the changes in Section 3.3
