An blowing to the exhaust pipe at all times and never a rich, ECM controlled and monitor temperature of the exhaust. The air intake system will be in charge of the air intake system. There should be no air in the exhaust pipe while operating in the "Cold start" mode.

DIAGNOSIS

The diagnosis of the A.I.R. system is covered in CHART C-4 on the next document.

OPERATIONAL CHECKS

A.I.R. System Pump

1. The air pump is a positive displacement unit which is permanently lubricated and requires no periodic maintenance.
2. The pump is approximately 100 psi and should not flow back into the air intake system. It is designed to operate in a vacuum, not in a positive pressure. If an air flow is observed at a full pressure, the pump is faulty.

Inspect

For proper drive belt tension.

1. For a faulty pressure relief valve. Air has to be vented back into the pump housing.

NOTICE: If the engine or exhaust temperature is to be checked, and there is a high pressure, the pressure relief valve should be checked off or pressure should be vented back into the pump.

NOTICE: The A.I.R. system is not inherently self-cleaning. Under normal conditions, the air intake system will clean the pump. To determine if the pump is clean, the top of the air intake system should be removed. If excessive dirt is on the top, the pump is dirty and should be cleaned. If excessive dirt is on the top, the pump is dirty and should be cleaned.

Inspect

For correct timing.

1. Hoses, tubes and all connections for total belt proper timing.
2. For air flow from the air intake system.
3. For proper timing and belt tension.
4. If no improvement is seen, and the A.I.R. system pump is still working, replace the pump.

NOTICE: Do not oil pump.

Remove or Disconnect
