Martin Isaacs, 2009 One of the challenges many mathematics students face occurs after they complete their study of basic calculus and linear algebra and they start taking courses where they are expected to write proofs Historically students have been learning to think mathematically and to write proofs by studying Euclidean geometry In the author s

opinion geometry is still the best way to make the transition from elementary to advanced mathematics The book begins with a thorough review of high school geometry then goes on to discuss special points associated with triangles circles and certain associated lines Ceva's theorem vector techniques of proof and compass and straightedge constructions There is also some emphasis on proving numerical formulas like the laws of sines cosines and tangents Stewart's theorem Ptolemy's theorem and the area formula of Heron An important difference of this book from the majority of modern college geometry texts is that it avoids axiomatics The students using this book have had very little experience with formal mathematics Instead the focus of the course and the book is on interesting theorems and on the techniques that can be used to prove them This makes the book suitable to second or third year mathematics majors and also to secondary mathematics education majors allowing the students to learn how to write proofs of mathematical results and at the end showing them what mathematics is really all about

*Mathematical Tasks in Classrooms Around the World*, 2010-01-01 Mathematical tasks have long been recognized as crucial mediators between mathematical content and the mathematics learner For many people the mathematics classroom is defined by the type of tasks one finds there and this is appropriate Mathematical tasks are the embodiment of the curricular pretext that brings each particular set of individuals together in every mathematics classroom In other contexts individuals come together to engage in musical performances or dramatic performances The performances of the mathematics classroom are largely the performance of mathematical tasks and if we are to understand and facilitate the learning that is the purpose of such settings then we must understand the nature of the performances that we find there The classroom performance of a task is ultimately a unique synthesis of task teacher students and situation Of particular interest are differences in the function of mathematically similar tasks when employed by different teachers in different classrooms for different instructional purposes with different students By making comparison possible between the classroom use of mathematical tasks in different classrooms around the world the analyses reported in this book reveal the profound differences in how each teacher utilises mathematical tasks in partnership with their students to create a distinctive form of mathematical activity The Learner's Perspective Study aims to juxtapose the observable practices of the classroom and the meanings attributed to those practices by classroom participants The LPS research design documents sequences of at least ten lessons using three video cameras supplemented by the reconstructive accounts of classroom participants obtained in post lesson video stimulated interviews and by test and questionnaire data and copies of student written material In each participating country data generation focuses on the classrooms of three teachers identified by the local mathematics education community as competent and situated in demographically different school communities within the one major city The large body of complex data supports both the characterisation of practice in the classrooms of competent teachers and the development of theory
