Saguaro Cactus

What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in 1969, based on his work with intertidal invertebrates. The term "keystone" is derived from the keystone of an arch, which is the central, topmost stone that holds the entire structure together.

The Saguaro Cactus is a keystone species in the Sonoran Desert. It provides food and shelter for many animals, including birds, lizards, and snakes. The cactus also plays a role in the desert's water cycle, storing water in its thick, fleshy stems. Without the Saguaro Cactus, the desert ecosystem would be fundamentally altered.
