evolution - change overtime

biological evolution - consists of genetic change in populations of organisms across generations

the two naturalists from England who established the idea of natural selection - 1.

Alfred Russel Wallace

2. Charles Darwin

where Alfred studied natural selection - Archipelago

where Charles Darwin studied natural selection - on his voyage of HMS Beagle

HMS Beagle - Charles Darwins book published that explained his belief of natural selection

Natural Selection - process by which inherited characteristics enhance survival reproduction

3 premises of natural selection - 1. organisms face a constant struggle to survive and reproduce

2. organisms tend to produce more offspring than can survive

3. individuals of a species vary in their characteristics

adaptive traits - genes are passed to offspring and those of better adapted parents will succeed because they will better adapt through time

adaption - trait that promotes success

artificial selection - selection conducted under human direction

examples of artificial selection - 1. dog breeding

2. plant breeding (broccoli, cauliflower, brussel sprouts)

speciation - process in which new species are generated

allopatric speciation - species formation due to physical separation of populations over geographic distance

how allopatric speciation works - other DNA combines with other species and mutations begin to form

Phylogenetic Trees - depict relationships among species, major groups of species, populations, or genes

Extinction - the disappearance of a species from earth

why extinction is a natural process - when conditions naturally change and a species does not have enough time to adapt and work with the change

example of extinction as a natural process - rise&fall of sea level, arrival of new species, severe weather events

mass extinction events - massive disappearance of species at once

what mass extinction our world is in currently - 6th mass extinction event due to human impact

Adaptation in Natural and Artificial Systems John H. Holland, 1992-04-29 Genetic algorithms are playing an increasingly important role in studies of complex adaptive systems ranging from adaptive agents in economic theory to the use of machine learning techniques in the design of complex devices such as aircraft turbines and integrated circuits Adaptation in Natural and Artificial Systems is the book that initiated this field of study presenting the theoretical foundations and exploring applications In its most familiar form adaptation is a biological process whereby organisms evolve by rearranging genetic material to survive in environments confronting them In this now classic work Holland presents a mathematical model that allows for the nonlinearity of such complex interactions He demonstrates the model s universality by applying it to economics physiological psychology game theory and artificial intelligence and then outlines the way in which this approach modifies the traditional views of mathematical genetics Initially applying his concepts to simply defined artificial systems with limited numbers of parameters Holland goes on to explore their use in the study of a wide range of complex naturally occuring processes concentrating on systems having multiple factors that interact in nonlinear ways Along the way he accounts for major effects of coadaptation and coevolution the emergence of building blocks or schemata that are recombined and passed on to succeeding generations to provide innovations and improvements
