robotic cars in practice This dissertation presents selected perception technologies for autonomous driving in the context of Stanford's autonomous cars We consider speed selection in response to terrain conditions smooth road finding improved visual feature optimization and cost effective car detection Our work does not rely on manual engineering or even supervised machine learning Rather the car learns on its own training itself without human teaching or labeling We show this self supervised learning often meets or exceeds traditional methods Furthermore we feel self supervised learning is the only approach with the potential to provide the very low failure rates necessary to improve on human driving performance
