

Combination Notes for Wind Patterns

The atmosphere has wind patterns.

Uneven heating causes air to move.

- Weather- the condition of Earth's atmosphere at a particular time and place
- Wind- air that moves horizontally (parallel to the ground)
- Air is set in motion by uneven heating of Earth's surface (pressure differences)
- Air moves from higher pressure to lower pressure (over a short distance)
- Differences in air pressure cause winds
- Difference in air pressure determines the strength of wind
- How wind forms:

- 1) Sunlight warms ground>ground warms the air>warm air rises>low pressure forms
- 2) Sunlight warms a portion of the ground>cooler, less dense air sinks>high pressure forms
- 3) Air moves as wind from high to low pressure

Patterns of heating and cooling cause local winds

- Local winds:
 - 1) **sea and land breezes (occur near shorelines)**
Sea breeze – during the day, land heats up>air over land rises and expands>denser ocean air moves into area of low pressure (land)
Land breeze – during the night, land cools>warm air rises over the ocean>cooler air flows in from the land towards the sea
