

Section 7.3 – Genetic Linkage & Mapping

Linkage Maps – diagram/model that shows the relative locations of genes on chromosomes

- uses a scale of map units (m.u.)
- 1 m.u. = 1 % chance of crossing over together

What percentage chance does gene A & gene B have of being inherited together if they are 6m.u. apart?

6%

What is the math term that describes this relationship?

What is farther apart on a chromosome, genes that are 1m.u. apart or those that are 10m.u. apart?

10%

Advances in Statistical Methods for the Genetic Dissection of Complex Traits in Plants Yuan-Ming Zhang, Zhenyu Jia, Shang-Qian Xie, Jia Wen, Shibo Wang, Ya-Wen Zhang, 2024-01-26

Genome wide association studies GWAS have been widely used in the genetic dissection of complex traits However there are still limits in current GWAS statistics For example 1 almost all the existing methods do not estimate additive and dominance effects in quantitative trait nucleotide QTN detection 2 the methods for detecting QTN by environment interaction QEI are not straightforward and do not estimate additive and dominance effects as well as additive by environment and dominance by environment interaction effects leading to unreliable results and 3 no or too simple polygenic background controls have been employed in QTN by QTN interaction QQI detection As a result few studies of QEI and QQI for complex traits have been reported based on multiple environment experiments Recently new statistical tools including 3VmrMLM have been developed to address these needs in GWAS In 3VmrMLM all the trait associated effects including QTN QEI and QQI related effects are compressed into a single effect related vector while all the polygenic backgrounds are compressed into a single polygenic effect matrix These compressed parameters can be accurately and efficiently estimated through a unified mixed model analysis To further validate these new GWAS methods particularly 3VmrMLM they should be rigorously tested in real data of various plants and a wide range of other species

Genomic Designing for Biotic Stress Resistant Vegetable Crops Chittaranjan Kole, 2022-07-02

Biotic stresses cause yield loss of 31 42% in crops in addition to 6 20% during post harvest stage Understanding interaction of crop plants to the biotic stresses caused by insects bacteria fungi viruses and oomycetes etc is important to develop resistant crop varieties Knowledge on the advanced genetic and genomic crop improvement strategies including molecular breeding transgenics genomics assisted breeding and the recently emerging genome editing for developing resistant varieties in vegetable crops is imperative for addressing FPNEE food health nutrition energy and environment security Whole genome sequencing of these crops followed by genotyping by sequencing have facilitated precise information about the genes conferring resistance useful for gene discovery allele mining and shuttle breeding which in turn opened up the scope for designing crop genomes with resistance to biotic stresses The nine chapters each dedicated to a vegetable crop or crop group in this volume will deliberate on different types of biotic stress agents and their effects on and interaction with crop plants will enumerate on the available

genetic diversity with regard to biotic stress resistance among available cultivars illuminate on the potential gene pools for utilization in interspecific gene transfer will brief on the classical genetics of stress resistance and traditional breeding for transferring them to their cultivated counterparts will enunciate the success stories of genetic engineering for developing biotic stress resistant varieties will discuss on molecular mapping of genes and QTLs underlying biotic stress resistance and their marker assisted introgression into elite varieties will enunciate on different emerging genomics aided techniques including genomic selection allele mining gene discovery and gene pyramiding for developing resistant crop varieties with higher quantity and better quality and will also elaborate some case studies on genome editing focusing on specific genes for generating disease and insect resistant crops
