Chemical Systems using Cellular Automata Lemont B. Kier,Paul G. Seybold,Chao-Kun Cheng,2006-02-23 Modeling Chemical

Systems using Cellular Automata provides a practical introduction to an exciting modeling paradigm for complex systems The book first discusses the nature of scientific inquiry using models and simulations and then describes the nature of cellular automata models. It then gives detailed descriptions with examples and exercises of how cellular automata models can be used in the study of a wide variety chemical physical and biochemical phenomena Topics covered include models of water itself solution phenomena solution interactions with stationary systems first and second order kinetic phenomena enzyme kinetics vapor liquid equilibrium and atomic and molecular excited state kinetics. The student experiences these systems

through hands on examples and guided studies This book is the first of its kind a textbook and a laboratory manual about cellular automata modeling of common systems in chemistry The book is designed to be used as a text in undergraduate courses dealing with complex systems and or as a computational supplement to laboratory courses taught at the undergraduate level The book includes Compact descriptions of a large variety of physical and chemical phenomena Illustrative examples of simulations with exercises for further study An instructor's manual for use of the program The book will be of great value in undergraduate courses in chemistry physics biology applied mathematics and bioinformatics and as a supplement for laboratory courses in introductory chemistry organic chemistry physical chemistry medicinal chemistry chemical engineering and other courses dealing with statistical and dynamic systems It allows the exploration of a wide range of dynamic phenomena many of which are not normally accessible within conventional laboratory settings due to limitations of time cost and experimental equipment Thebook is both a textbook on applied Cellular Automata and a lab manual for chemistry physics engineering courses with lab activity. It would supplement other lab work and be an additional book the students would use in the course The authors have assessed the emerging need for this kind of activity in science labs because of the cost of the practical activitites and the frequent failure of some exercises leading to lost didactic value of some experiments This book is pioneering an alternative that will grow in use There are no course directors who would use Cellular Automata exclusively The authors see an emerging interest in this kind of work in courses that contain lab exercises One such course is the graduate course that Lemont Kier gives in Life Sciences about complexity He uses many examples and studies from Cellular Automata in the latter part of this course International Textbook of Diabetes Mellitus R.
