

Keystone Species

Saguaro Cactus

What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in 1969, based on his studies of intertidal rocky shore communities. The term "keystone" is derived from the keystone of an arch, which is the central, topmost stone that holds the entire structure together.

Keystone species can be found in all types of ecosystems, from marine environments to terrestrial ones. They often play a critical role in maintaining the structure and function of their ecosystems. For example, in a forest, a keystone species might be a large tree that provides habitat for many other species, or a predator that keeps herbivore populations in check.

Why is the Saguaro a keystone species?

The Saguaro cactus is a keystone species in the Sonoran Desert. It provides habitat for many other species, including birds, lizards, and insects. The cactus also plays a role in the desert's water cycle, storing water in its thick stems and releasing it slowly over time. Without the Saguaro, the desert ecosystem would be very different.

For more information, visit the Saguaro National Monument website at www.saguaronationalmonument.gov. You can also find out more about the Saguaro cactus by visiting the National Park Service website at www.nps.gov.
