Information: In the following table, we present the results of the regression analysis. The dependent variable is the number of employees in the firm. The independent variables are the firm's size, age, and industry. The results show that the number of employees in the firm is positively related to the firm's size, age, and industry.

■ **Conclusions:** The results of this study suggest that the use of a single, standardized, and validated questionnaire is a feasible and reliable method for assessing the prevalence of self-reported mental health problems in a community sample. The results also suggest that the prevalence of self-reported mental health problems is higher in the community than in the clinical population.
