Continuous Models for Cameras and Inertial Sensors Hannes Ovrén, 2018-07-25 Using images to reconstruct the world in three dimensions is a classical computer vision task Some examples of applications where this is useful are autonomous mapping and navigation urban planning and special effects in movies One common approach to 3D reconstruction is structure from motion where a scene is imaged multiple times from different positions e g by moving the camera However in a twist of irony many structure from motion methods work best when the camera is stationary while the image is captured This is because the motion of the camera can cause distortions in the image that lead to worse image measurements and thus a worse reconstruction One such distortion common to all cameras is motion blur while another is connected to the use of an electronic rolling shutter Instead of capturing all pixels of the image at once a camera with a rolling shutter captures the image row by row If the camera is moving while the image is captured the rolling shutter causes non rigid distortions in the image that unless handled can severely impact the reconstruction quality This thesis studies methods to robustly perform 3D reconstruction in the case of a moving camera To do so the proposed methods make use of an inertial measurement unit IMU The IMU measures the angular velocities and linear accelerations of the camera and these

can be used to estimate the trajectory of the camera over time Knowledge of the camera motion can then be used to correct for the distortions caused by the rolling shutter Another benefit of an IMU is that it can provide measurements also in situations when a camera can not e g because of excessive motion blur or absence of scene structure To use a camera together with an IMU the camera IMU system must be jointly calibrated The relationship between their respective coordinate frames need to be established and their timings need to be synchronized This thesis shows how to automatically perform this calibration and synchronization without requiring e g calibration objects or special motion patterns In standard structure from motion the camera trajectory is modeled as discrete poses with one pose per image Switching instead to a formulation with a continuous time camera trajectory provides a natural way to handle rolling shutter distortions and also to incorporate inertial measurements To model the continuous time trajectory many authors have used splines The ability for a spline based trajectory to model the real motion depends on the density of its spline knots Choosing a too smooth spline results in approximation errors This thesis proposes a method to estimate the spline approximation error and use it to better balance camera and IMU measurements when used in a sensor fusion framework Also proposed is a way to automatically decide how dense the spline needs to be to achieve a good reconstruction Another approach to reconstruct a 3D scene is to use a camera that directly measures depth Some depth cameras like the well known Microsoft Kinect are susceptible to the same rolling shutter effects as normal cameras This thesis quantifies the effect of the rolling shutter distortion on 3D reconstruction depending on the amount of motion It is also shown that a better 3D model is obtained if the depth images are corrected using inertial measurements Att anv nda bilder f r att terskapa v rlden omkring oss i tre dimensioner r ett klassiskt problem inom datorseende N gra exempel p anv ndningsomr den r inom navigering och kartering f r autonoma system stadsplanering och specialeffekter f r film och spel En vanlig metod f r 3D rekonstruktion r det som kallas struktur fr n r relse Namnet kommer sig av att man avbildar fotograferar en milj fr n flera olika platser till exempel genom att flytta kameran Det r d rf r n got ironiskt att m nga struktur fr n r relse algoritmer f r problem om kameran inte r stilla n r bilderna tas exempelvis genom att anv nda sig av ett stativ Anledningen r att en kamera i r relse ger upphov till st rningar i bilden vilket ger s mre bildm tningar och d rmed en s mre 3D rekonstruktion Ett v lk nt exempel r r relseosk rpa medan ett annat r kopplat till anv ndandet av en elektronisk rullande slutare I en kamera med rullande slutare avbildas inte alla pixlar i bilden samtidigt utan ist llet rad f r rad Om kameran r r p sig medan bilden tas uppst r d rf r st rningar i bilden som m ste tas om hand om f r att f en bra rekonstruktion Den h r avhandlingen ber r robusta metoder f r 3D rekonstruktion med r rliga kameror En r d tr d inom arbetet r anv ndandet av en tr ghetssensor IMU En IMU m ter vinkelhastigheter och accelerationer och dessa m tningar kan anv ndas f r att best mma hur kameran har r rt sig ver tid Kunskap om kamerans r relse ger m jlighet att korrigera f r st rningar p grund av den rullande slutaren Ytterligare en f rdel med en IMU r att den ger m tningar ven i de fall d en kamera inte kan g ra det Exempel p s dana fall r vid extrem r relseosk rpa starkt motljus eller om det saknas struktur i bilden Om

man vill använda en kamera tillsammans med en IMU så måste dessa kalibreras och synkroniseras relationen mellan deras respektive koordinatsystem måste bestämmas och de måste vara överens om vad klockan är I den här avhandlingen presenteras en metod för att automatiskt kalibrera och synkronisera ett kamera IMU system utan krav på exempelvis kalibreringsobjekt eller speciella relationer I klassisk struktur för relationer representeras kamerans relation av att varje bild beskrivs med en kamera pose Om man istället representerar kamerarelsen som en tidskontinuerlig trajektoria kan man på ett naturligt sätt hantera problematiken kring rullande slutare Det går det också enkelt att införa trigonometriska funktioner från en IMU En tidskontinuerlig kameratrajektoria kan skapas på flera sätt men en vanlig metod är att använda sig av så kallade splines Formen hos en spline att representera den faktiska kamerarelsen beror på hur tät dess knutar placeras Den här avhandlingen presenterar en metod för att uppskatta det approximationsfel som uppkommer vid valet av en förgles spline Det uppskattade approximationsfelet kan sedan användas för att balansera funktioner från kameran och IMU när dessa används för sensorfusion Avhandlingen innehåller också en metod för att bestämma hur tät en spline behöver vara för att ge ett gott resultat En annan metod för 3D rekonstruktion är att använda en kamera som också mäter djup eller avstånd Vissa djupkameror till exempel Microsoft Kinect har samma problematik med rullande slutare som vanliga kameror I den här avhandlingen visas hur den rullande slutaren i kombination med olika typer och storlekar av relationer påverkar den terskapade 3D modellen Genom att använda trigonometriska funktioner från en IMU kan djupbilderna korrigeras vilket visar sig ge en bättre 3D modell
