Small-Scale Energy Systems with Gas Turbines and Heat Pumps Satoru Okamoto, 2021-03-29 A heat pump system can produce an amount of heat energy that is greater than the amount of energy used to run the heat pump system. Thus a heat pump system is considered to be a machine system that can use energies efficiently as is the load leveling air conditioning system utilizing unutilized energies at high levels. Adaptations of gas turbines for industrial utility and marine propulsion applications have long been accepted as means for generating power with high efficiency and ease of maintenance. Cogeneration with gas turbine is frequently defined as the sequential production of useful thermal energy and shaft power from a single energy source. For applications that generate electricity the power can either be used internally or supplied to the utility grid. This Special Issue intends to provide an overview of the existing knowledge related with various aspects of Small Scale Energy Systems with Gas Turbines and Heat Pumps and contributions on but not limited to the following subjects were encouraged: wake of stator vane to improve sealing effectiveness; gas turbine cycle with external combustion chamber for prosumer and distributed energy systems; computational simulation of gas turbine engine operating with different blends of biodiesel; experimental methodology and facility for the engine performance and emissions evaluation using jet and biodiesel blends; experimental analysis of an air heat pump for heating service; hybrid fuel cell Brayton cycle for combined heat and power; design analysis of micro gas turbines in closed cycles. Seven papers were published in the Special Issue out of a total of 12 submitted.

**General Aviation Aircraft Design** Snorri Gudmundsson, 2021-10-31 General Aviation Aircraft Design Second Edition continues to be the engineer's best source for answers to realistic aircraft design questions. The book has been expanded to provide design guidance for additional classes of aircraft including seaplanes, biplanes, UAS, high speed business jets and electric airplanes. In addition to conventional powerplants, design guidance for battery systems, electric motors and complete electric powertrains is offered. The second edition contains new chapters: Thrust Modeling for Gas Turbines, Longitudinal Stability and Control, Lateral and Directional Stability and Control. These new chapters offer multiple practical methods to simplify the estimation of stability derivatives and introduce hinge moments and basic control system design. Furthermore, all chapters have been reorganized and feature updated material with additional analysis methods. This edition also provides an introduction to design optimization using a wing optimization as an example for the beginner. Written by an engineer with more than 25 years of design experience, professional engineers, aircraft designers, aerodynamicists, structural analysts, performance analysts, researchers and aerospace engineering students will value the book as the classic go-to for aircraft design. The printed book is now in color with 1011 figures and illustrations. Presents the most common methods for conceptual aircraft design. Clear presentation splits text into shaded regions separating engineering topics from mathematical derivations and examples. Design topics range from the new 14 CFR Part 23 to analysis of ducted fans. All chapters feature updated material with additional analysis methods. Many chapters have been
