Contaminant Transport Jacob Bear, Alexander H.-D. Cheng, 2010-01-18 In many parts of the world groundwater resources are under increasing threat from growing demands wasteful use and contamination To face the challenge good planning and management practices are needed A key to the management of groundwater is the ability to model the movement of fluids and contaminants in the subsurface The purpose of this book is to construct conceptual and mathematical models that can provide the information required for making decisions associated with the management of groundwater resources and the remediation of contaminated aquifers The basic approach of this book is to accurately describe the underlying physics of groundwater flow and solute transport in heterogeneous porous media starting at the microscopic level and to rigorously derive their mathematical representation at the macroscopic levels The well posed macroscopic mathematical models are formulated for saturated single phase flow as well as for unsaturated and multiphase flow and for the transport of single and multiple chemical species Numerical models are presented and computer codes are reviewed as tools for solving the models The problem of seawater intrusion into coastal aquifers is examined and modeled The issues of uncertainty in model input data and output are addressed The book concludes with a chapter on the management of groundwater resources Although one of the main objectives of this book is to construct mathematical models the amount of mathematics required is kept minimal

Exhaust Plume Temperature Effects on Nozzle Afterbody Performance

Over the Transonic Mach Number Range C. E. Robinson, M. Dean High, 1974 Results of an experimental and analytical research investigation on nozzle afterbody drag are presented Experimental afterbody and boattail drag coefficients and pressure distributions are discussed for an isolated strut mounted nozzle afterbody model for the Mach number range from 0.6 to 1.5 Some data are also given for free stream unit Reynolds numbers from one million to approximately four million per foot The experimental data were obtained for the basic model with an air cooled and a water cooled Ethylene air combustor to provide hot jet duplication as well as cold jet simulation The temperature of the nozzle exhaust gas was varied from 530R burner off to approximately 2500R for several nozzle pressure ratios from jet off to those corresponding to a moderately under expanded exhaust plume The initial series of experiments was conducted with the air cooled combustors and the effect of jet temperature on afterbody drag was somewhat masked by the effects of the secondary airflow from the cooling air The general trend however shows a decreasing afterbody drag with increasing exhaust gas temperature and with decreasing secondary airflow at a fixed nozzle pressure ratio Modified author abstract
