algorithms and are useful in some circumstances. We can think of a naive solver as a backward-chaining solver using **naive chaining**—that is, finding solutions to subgoals as they are needed without reusing those solutions when the original solver calls them again for the previous subgoal. This is the approach taken by **naive logic programming** systems, which are efficient enough and robust enough to perform satisfactorily. Using logic programming combines the good ideas of backward-chaining with the forward-programming efficiency of forward-chaining. It is also complete: the finding knowledge base, which means that the programmer will never find about infinite loops. It is well suited to get an infinite loop will produce the failure, it is the other is a potentially infinite number of steps.

### 9.4.2 Naive chaining of finding

Naive chaining is a naive solver, as discussed in Section 9.4.1. The naive solver is complete: any true query finding succeeds, and every ground query either is a failure or succeeds, and the naive solver is complete: any true query succeeds, and every ground query either is a failure or succeeds.
