Within the joint German Russian research project Siberian River Run off SIRRO multidisciplinary studies were carried out in the Ob and Yenisei estuaries and adjacent southern Kara Sea Arctic Ocean The overall goal of the project was to extend knowledge on understanding the freshwater and sediment input by the major Siberian rivers and its impact on the environments of the inner Kara Sea The main results of oceanographical biological geochemical geological and modelling studies are presented in four main chapters OCEANOGRAPHY LAB MANUAL. the mass balance and salinity of Arctic and Antarctic sea ice Martin Vancoppenolle, 2008 Ice formed from seawater called sea ice is both an important actor in and a sensitive indicator of climate change Covering 7% of the World Ocean sea ice damps the atmosphere ocean exchanges of heat radiation and momentum in polar regions It also affects the oceanic circulation at a global scale Recent satellite and submarine observations systems indicate a sharp decrease in the extent and volume of Arctic sea ice over the last 30 years In addition climate models project drastic sea ice reductions for the next century in both hemispheres with potentially large consequences on climate and ecosystems Contrary to what is commonly believed sea ice retains about 25% of the oceanic salt when it forms As salt cannot lock in the ice crystalline lattice it accumulates in liquid inclusions of salty water brine Under a temperature change the inclusions freeze or melt and release or absorb huge amounts of latent heat This affects heat transfer through and storage in sea ice which may affect the mass balance of sea ice at a global scale This is the central hypothesis of this work In order to address this problem the author develops two sea ice models and assesses their ability to simulate the recent evolution of the sea ice mass balance Then the physics of brine uptake and drainage are included in the models and sea ice desalination is investigated Finally the impact of sea ice salinity variations on the global sea ice mass balance is studied The roles of sea ice thermal properties of ice ocean salt fresh water fluxes and of oceanic feedbacks are evaluated The new salinity module improves the simulation of ice and ocean characteristics compared to observations Including salinity variations increases ice growth reduces vertical mixing in the ocean and the ocean to ice heat flux In conclusion salinity variations should be included in future sea ice models used for climate projections **Laboratory Exercises in Oceanography** Harold Thurman, 1995 A stand alone lab manual for any
