Supporting Teachers' Formative Assessment Practice with Learning Progressions Erin Furtak, 2017-10-05 This book presents the results of a four year National Science Foundation funded project that engaged nine high school biology teachers at three public high schools in long term on site professional development program centered on a learning progression It explores the influence of teacher participation in this professional development experience on their learning about student thinking formative assessment task design classroom practices and student learning Taking an in depth look at the multiple sources of data gathered as part of the study this volume reflects on the emergence of professional communities focused on formative assessment design and enactments and associations between teacher participation in learning progression centered professional development and student learning

The Role of Selection in Speciation Judith Masters, **Speciation in Birds** Trevor Price, 2008 In *Speciation in Birds* Trevor Price a University of Chicago professor and leading expert in the field has written the most authoritative and modern synthesis on the subject to date In clear and engaging prose and through beautiful illustrations Price shows us why the field is as exciting and vibrant as ever He evaluates the roles of natural selection and sexual selection He asks how speciation contributes to some of the great patterns in species diversity such as the large number of species in the tropics and the many endemic species on isolated islands Throughout the book Price emphasizes the integration of behavior ecology and genetics

Selection and Speciation MacDonald, Geographic Variation, Speciation and Clines John A. Endler, 2020-03-31 *Geographic Variation Speciation and Clines* explores the origins and development of geographic variation divergence and speciation In particular it is concerned with genetic divergence as it is usually found on continents among groups of populations isolated only by distance Although earlier writers on this topic considered the effects of geography and dispersal intense geographic differentiation and speciation were thought to require complete isolation Professor Endler shows how geographic differentiation and speciation may develop in spite of continuous gene flow Following a review of the diverse and scattered literature on gene flow and population differentiation the author discusses the relationships among gene flow dispersal and migration He then summarizes the factors which limit the geographic extent of gene flow and those which allow steep clines to develop in the absence of barriers to gene flow His analysis draws on examples from the field experiments and single and multiple locus models The mechanism and conditions for parapatric speciation are presented steepening clines development into hybrid zones and the evolution of sexual isolation In the final chapter the author considers the interpretation of natural clines and the associated geographic patterns of subspecies and species

Genetics of Speciation David L. Jameson, 1977 *Selection, sex, speciation and species* Andrew Cockburn, 1991 Genetics of Mate Choice: From Sexual Selection to Sexual Isolation W.J. Etges, M.A. Noor, 2012-12-06 Genetic studies aimed at understanding the origin of species are dominating major scientific journals In the past decade genetic tools that were previously available only in model systems

have become accessible to investigators working on nearly all species Concurrent with these technical advances has been an increase in understanding of both the importance of considering the ecological context of speciation and testing hypotheses about causes for species formation Many recent studies suggest a prominent role of sexual selection in species formation These advances have produced a need for a synthesis of what we now understand about speciation and perhaps more importantly where we should go from here In this volume several leading investigators and rising stars have contributed reviews and or novel primary research findings aimed at understanding the ultimate mystery on which Darwin named his most famous and influential book Fundamental to the origin of species is the evolution of mate choice systems This collection of papers discusses burgeoning genetic evolutionary and ecological approaches to understanding the origins of mating discrimination and causes of premating reproductive isolation both within and between species The individual contributions span a wide spectrum of disciplines taxa and ideas some controversial This synthesis brings together several of the most recent ideas with supporting empirical data This book will be of particular interest to both undergraduate and postgraduate researchers and students and researchers in the field of evolutionary biology genetics and animal behaviour *Speciation*

On the Origin of Species Through Heteropatric

Differentiation Kevin Winker, 2010-11 Differentiation and speciation without extended isolation appear to be common among migratory animals Historical oversight of this is probably due to temporal distortion in distribution maps and a tendency to consider that lineages had different historical traits such as being sedentary or much less mobile Mobility among cyclic migrants makes population isolation difficult and diminished levels of intraspecific differentiation occur in avian migrants I term this Montgomery's rule Nevertheless many lineages have differentiated despite increased mobility and a high propensity for gene flow conditions that speciation theory has not addressed adequately Populations of seasonal migrants usually occur in allopatry and sympatry during a migratory cycle and this distributional pattern heteropatry is the focus of a model empirically developed to explain differentiation in migratory lineages Divergence arises through disruptive selection from resource competition and heterogeneously distributed cyclic resources Heteropatric speciation is a type of ecological speciation in which reproductive isolation increases between populations as a byproduct of adaptation to different environments that enhances breeding allopatry and allochrony despite degrees of sympatry that occur during the nonbreeding period in migration cycles Mating or pair bonding in nonbreeding areas is rare Patterns such as leapfrog migration and limited morphological divergence suggest that differentiation is driven by these ecological factors rather than by sexual selection or nontemporal changes in the resource base itself although the additional presence of either of the latter would have additive divergent effects Migratory lineages provide a largely neglected series of natural experiments in speciation in which to test predictions stemming from this model and others focusing on ecological speciation *Natural Selection* 71 *Success Secrets - 71 Most Asked Questions on Natural Selection - What You Need to Know* Kevin

Endler,2020-03-31 Natural selection is an immense and important subject yet there have been few attempts to summarize its effects on natural populations and fewer still which discuss the problems of working with natural selection in the wild These are the purposes of John Endler s book In it he discusses the methods and problems involved in the demonstration and measurement of natural selection presents the critical evidence for its existence and places it in an evolutionary perspective Professor Endler finds that there are a remarkable number of direct demonstrations of selection in a wide variety of animals and plants The

distribution of observed magnitudes of selection in natural populations is surprisingly broad and it overlaps extensively the range of values found in artificial selection He argues that the common assumption that selection is usually weak in natural populations is no longer tenable but that natural selection is only one component of the process of evolution natural selection can explain the change of frequencies of variants but not their origins

Color Variation and Its Role in Speciation Florine Pascal, 2022

The study of intraspecific contact zones can provide important insights into the processes that underlie lineage divergence and potentially mediate speciation Contact zones frequently exhibit some level of hybridization among lineages with the consequences of hybridization on speciation depending in part on the strength of selection Here we focused on a red eyed treefrog *Agalychnis callidryas* contact zone *Agalychnis callidryas* is a brightly colored and polymorphic frog with a broad distribution throughout Central America Populations differ greatly in leg color stripe pattern size call and skin peptide composition but most populations in Costa Rica and Panama exhibit relatively little variation in phenotype Females the choosier sex prefer males from their own population indicating a role of premating reproductive isolation on lineage divergence Previously our lab identified a contact zone between two *A. callidryas* lineages consisting of multiple phenotypes and late generation hybrids Here we characterize the phenotypes from five populations along this contact zone focusing primarily on leg color and stripe type We then use the quantification of color pattern variation to identify evidence of naturally occurring mate choice We found complex continuous color variation along the contact zone and evidence of assortative mating in the parental population but random mating in the contact zone We found evidence of directional selection in both parental and contact zone populations Combined these data assess the potential for lineage divergence between the two parent populations in this dynamic system

Speciation and the Recognition Concept David M. Lambert, Hamish G. Spencer, 1995 Developed by Hugh E H Paterson in the 1970s the Recognition Concept of Species stressed the importance of the Specific Mate Recognition System SMRS and offered a view of species which was radically different from the traditional Isolation Concept Paterson held that new species were formed through incidental changes in the SMRS rather than being directly promoted In the two decades since Paterson first advanced his theory evolutionary biologists around the world have had the opportunity to use this approach in their work Speciation and the Recognition Concept is the first book to bring together a group of leading researchers to examine the relevance of Paterson's ideas today for this important topic in evolutionary biology Representing a wide variety of viewpoints the contributors explore the consequences of applying the concept to areas as diverse as the fossil record insect taxonomy the structure of mate

recognition systems speciation models and the concept function in biology The Recognition Concept of species write the editors is important to biology because it represents an innovative approach to the resolution of the problem of biological diversity The concept is based upon an analysis of the logic and language of species studies Consequently it offers significant implications for ideas about the origin of species **Speciation in Tropical Environments** R.
