Cell Cycle Regulation

How does a cell know it is time to divide?

Why?

Quality control inspectors typically do not limit their product testing to the final product at the end of the assembly line. They monitor all aspects of production in hopes of preventing larger problems down the line. Likewise, when cells are progressing through the cell cycle these are processes in place that check on the cell's progress. Is everything happening according to plan? Are there sufficient resources to complete the task of cell division? Tightly regulating the cell cycle keeps a multicellular organism healthy by conserving materials. This ensures that new cells receive accurate genetic information, and also prevents uncontrolled growth that may lead to diseases like cancer.

Model 1 – The Cell Cycle

1. Review the phases of the cell cycle in Model 1 by placing the abbreviated phase name (G_1 , S, G_2 , or M) next to the proper description.

<u>G_1</u>	The cell grows by producing more proteins and organelles.
<u>S</u>	DNA replication occurs.
<u>G_2</u>	The cell prepares for cell division with the appearance of centrosomes.
<u>M</u>	Mitosis and cytokinesis occurs.

2. Some cells, like mature nerve cells or muscle cells, do not divide. Other cells will divide only when the cellular environment signals that it is necessary. According to Model 1, what "phase" of the cell cycle are these cells said to be in when they are not dividing or planning to divide?

PDGF = platelet derived growth factor

Edmunds,1984-05-24 **Multiscale Modeling for the Regulation of Cell Cycle by the Circadian Clock** Raouf El Cheikh,2015 This thesis is dedicated to the development of a multiscale mathematical model that describes the regulation of the cell cycle by the circadian clock What motivated this work is the fact that several tumorigenic diseases are linked to circadian rhythms disruption We would like to understand the effect of circadian rhythms on the proliferation of a cell population and hence give plausible explanation for diseases that arise form circadian clock disruption The mammalian cell cycle and the circadian clock are two molecular processes that operate in a rhythmic manner and exquisite precision On one hand the cell cycle is driven by the rhythmic activity of cyclin dependent kinases which dictate the time a cell must engage mitosis and the time it must divide giving birth to two daughter cells On the other hand the circadian clock is a system of transcriptional and translational feedback loops that generates sustained oscillations of different mRNAs and proteins with a period of approximately 24 h It turns out that several components of the circadian clock regulates various cyclin dependent kinases at different stages of the cell cycle This makes the circadian clock a key player of the temporal organization of the cell cycle and makes these two biological processes act as two tightly coupled oscillators Our modeling approach consists of using a molecular structured partial differential equation that describes the proliferation of a cell population Proliferation depends on the coupled cell cycle circadian clock molecular state of cells Due to the large number of molecular components involved in the cell cycle circadian clock system the problem becomes of high dimensionality and specific numerical techniques are needed to solve the equation **Special Issue: Oocyte Maturation and Cell Cycle Control** Farewell Symposium for Pr Marcel Dorée (2003, Denver, Colo.),Tim Hunt,Michel Philippe,2004
