

Enrichment

Enrichment is the process of increasing the nutrient levels in an ecosystem.

Effect

Enrichment can lead to a decrease in species diversity, as the system becomes dominated by a few species that are able to tolerate the high nutrient levels. This can lead to a loss of ecosystem services, such as the ability to filter water and provide habitat for other species.

Eutrophication National Academy of Sciences (U.S.),1969 Eutrophication and Land Use W. M. Jr. Lewis,J. F. Saunders,D. W. Crumpacker,C. M. Bredecke,2012-12-06 Nutrient enrichment eutrophication is a major theme in freshwater ecology Some themes come and go but the inevitable release of phosphorus and nitrogen that accompany human presence seems to ensure that eutrophication will not soon become an outmoded subject of study Eutrophication raises issues that range from the pressingly practical problems of phosphorus removal to the very fundamental ecological questions surrounding biological community regulation by resource supply Although it is possible to take a reductionist approach to some aspects of eutrophication the study of eutrophication is fundamentally a branch of ecosystem ecology To understand eutrophication in a given setting one is inevitably forced to consider physical chemical and biological phenomena together Thus while eutrophication is the focus of our study of Lake Dillon we have assumed that a broad base of limnological information is a prerequisite foundation Eutrophication of a lake can be studied strictly from a limnological perspective If so the nutrient income of the lake is quantified but the sources are combined within a black box whose only important feature is total loading It is also possible however to treat the watershed and lake as equally important components of a hybrid system In this case the nutrient sources must be dissected and their variability and dependence on key factors such as runoff must be quantified Eutrophication: Causes, Consequences and Control Abid A. Ansari,Sarvajeet Singh Gill,2013-11-19 Eutrophication continues to be a major global challenge and the problem of eutrophication and availability of freshwater for human consumption is an essential ecological issue The global demand for water resources due to increasing population economic developments and emerging energy development schemes has created new environmental challenges for global sustainability Accordingly the area of research on eutrophication has expanded considerably in recent years Eutrophication acidification and contamination by toxic substances are likely to pose increasing threats to freshwater resources and ecosystems The consequences of anthropogenic induced eutrophication of freshwaters are severe deterioration of surface waters and growing public concern as well as new interest among the scientific community Eutrophication causes consequences control provides the latest information on many important aspects of the processes of natural and accelerated eutrophication in major aquatic ecosystems around the world This book offers a cutting edge resource for researchers and students alike who are studying eutrophication in various ecosystems It presents the latest trends and developments in the field including global scenarios and local threats to the dynamics of aquatic ecosystems economics of eutrophication eutrophication in the great lakes of the Chinese pacific drainage basin photoautotrophic productivity in eutrophic ecosystems eutrophication s impacts on natural metal remediation in salt marshes phytoplankton assemblages as an indicator of water quality in seven temperate estuarine lakes in southeast Australia biogeochemical indicators of nutrient enrichments in wetlands the microbial response as a sensitive indicator of wetland eutrophication and ultraviolet radiation and bromide as
