Text Source: "Scientists Fear Spread of Exotic Snakes"

On The Left: The Source Direct Quote and Page Number	On The Right: The Response Sample Responses
"Scientists fear that Burmese pythons, already known to be breeding in South Florida, could spread through much of the southern United States" (UPI 151).	Questions How did these snakes end up in the wild in Florida?
"The snakes weigh up to 250 pounds and slither at a rate of 20 miles per month" (UPI 151). "If pet pythons were introduced into the wild in California by irresponsible pet owners, as happened in Florida, they could become established here even faster, without need of a cross country journey" (UPI 151). "So the absence of major predators outside of Florida could help the snakes on their journey west" (UPI 151).	Summary The Burmese pythons have the potential to spread through the southern part of the United States very rapidly. The snakes have the ability to move many miles from their breeding ground, and since they do not have any major predators the number of snakes will quickly increase.
"In Florida, they eat bobcats, deer, alligators, raccoons, cats, rats, rabbits, muskrats, possum, mice, ducks, egrets, herons and song birds" (UPI 151).	Reflections If the Burmese pythons spread they may wipe out other populations of animals in some areas.
