Neuron Structure

What are the essential structures that make up a neuron?

Why?

Cells are specialized for different functions in multicellular organisms. In animals, one unique kind of cell helps organisms survive by collecting information and sending messages throughout the body. The shapes and features of neurons, which are the primary cells in the nervous system, enable animals to experience all of the five senses; find food, mates, and shelter; and to survive in their diverse environments.

Model 1 - Parts of a Neuron

 Model 1 is an illustration of two neurons. Label one of the neurons in the diagram with the following structures:

Cell body or soma Axon
Cell nucleus Synapse

Dendrites

2. Which structure(s) on the neuron in Model 1 would receive a signal from either a sensory cell (taste bud, touch receptor, retinal cell) or from another neuron?

The structure that would signal from either a sensory cell to another neuron is the den

Palay, Henry de F. Webster, 1991 This book represents the most complete and authoritative description on the fine structure of the nervous system available in a single volume Beginning with background material on the neuron the book then examines specific portions of the nerve cell and of the various supporting cells Structure is first described in a general fashion followed by detailed coverage of the fine structure of each component with full discussion of how the structural features relate to their functions Extensively revised and rewritten this book will bring readers up to date with the many important developments that have taken place since publication of the previous edition It includes over 130 electron micrographs and line drawings many of which are new to this edition **Neuron Structure of the Brain, Engl** G. I. Neuron Structure-function Correspondence as Revealed by Biological Scaling Theory Paheli Poljakov, 1972 Desai-Chowdhry, 2023 Neurons are connected by complex branching processes that collectively process information for organisms to respond to their environment Classifying neurons according to differences in structure or function is a fundamental piece of neuroscience Here by constructing new biophysical theory and testing against our empirical measures of branching structure we establish a correspondence between neuron structure and function as mediated by principles such as time or power minimization for information processing as well as spatial constraints for forming connections Based on these principles we use Lagrange multipliers to predict scaling ratios for axon and dendrite sizes across branching levels We test our predictions for radius scale factors against those extracted from images measured for species that range from insects to whales Notably our findings reveal that the branching of axons and peripheral nervous system neurons is mainly determined by time minimization while dendritic branching is mainly determined by power minimization Further comparison of different dendritic cell types reveals that Purkinje cell dendrite branching is constrained by material costs while motoneuron dendrite branching is constrained by conduction time delay We extend this model to incorporate asymmetric branching where there are multiple different paths from the soma to the synapses and thus multiple interpretations of conduction time delay one considers the optimal path and the other considers the sum of all possible paths leading to different predictions We find that the data for motoneurons show a distinction between the asymmetric and symmetric branching junctions corresponding to predictions using different interpretations of the time delay constraint Moreover the more asymmetric branching junctions are localized near the synapses indicating that different functional principles affect the structure at different regions of the cell Finally we use machine learning methods to classify cell types using functionally relevant structural parameters derived from our model Incorporating branching level as a feature in classification in addition to parameters related to information flow improves performance across methods suggesting that information flow drives localized differences in morphology Future directions of this work include estimating specific parameters related to functional tradeoffs and myelination using numerical optimization and analyzing changes across stages of development

Johnston, Betty I. Roots, 2013-10-22 Nerve Membranes A Study of the Biological and Chemical Aspects of Neuron Glia Relationships presents the various aspects of neuronal and glial structure and function This book provides an interdisciplinary approach to the analysis of neuron glia relationships and of membranes in the nervous system Comprised of seven chapters this book begins with an overview of the function of the biological membranes to improve retard and regulate the rate of cellular reactions This text then determines the differences in the organization of the cells in the nervous system in the vertebrates and the invertebrates Other chapters examine the role of certain intermolecular forces and of water in the organization of lipid protein and lipid lipid associations This book reviews as well the theories of biological membrane structure and considers how these contribute towards understanding the methods by which membranes perform their role This book is a valuable resource for neuroscientists neurochemists and New Aspects of Axonal Structure and Function Dirk Feldmeyer, Joachim Lübke, 2010-08-18 Axons are researchers neuronal output elements and are responsible for the transfer and processing of signals from one neuron to another even over very large distances For a given neuronal cell type axons are unique and display very heterogeneous patterns with respect to shape length and target structure Axons are the usually long process of a nerve fiber that generally conducts impulses away from the body of the nerve cell This book is intended to summarize recent findings covering morphological physiological developmental computational and pathophysiological aspects of axons It attempts to cover new findings concerning axonal structure and functions together with their implications for signal transduction processes implicated in the formation of axonal arbors and the transport of subcellular elements to their targets and finally how a dysfunction in one or several of these steps could lead to axonal degeneration and ultimately to neurodegenerative diseases Neurons Gonzalo Emiliano Aranda Abreu, María Elena Hernández Aguilar, 2019-02-20 The brain is the most complex structure that exists in the universe consisting of neurons whose function is to receive information through dendrites and transmit information through the axon In neurosciences one of the main problems that exists are neurodegenerative diseases for which until now there has been no cure This book is mainly focused on updating the information on the signaling process carried out in the development of axons Topics such as axon guidance and its interaction with the extracellular matrix are discussed Other important topics are semaphorins and their relationship with neurodegenerative diseases and the neurobiology of the gap junction in the dorsal root ganglion Finally the topic of bioelectrical interfaces destined to regenerate damaged nerves is covered The information in this book will be very important both for researchers who work with these issues and doctoral students who are involved in neuroscience **The Neural Ring** Nora Esther Youngs, 2014 Neurons in the brain represent external stimuli via neural codes These codes often arise from stimulus response maps associating to each neuron a convex

receptive field An important problem confronted by the brain is to infer properties of a represented stimulus space without knowledge of the receptive fields using only the intrinsic structure of the neural code How does the brain do this To address this question it is important to determine what stimulus space features can in principle be extracted from neural codes This motivates us to define the neural ring and a related neural ideal algebraic objects that encode the full combinatorial data of a neural code We find that these objects can be expressed in a canonical form that directly translates to a minimal description of the receptive field structure intrinsic to the neural code We consider the algebraic properties of homomorphisms between neural rings which naturally relate to maps between neural codes We show that maps between two neural codes are in bijection with ring homomorphisms between the respective neural rings and define the notion of neural ring homomorphism a special restricted class of ring homomorphisms which preserve neuron structure We also find connections to Stanley Reisner rings and use ideas similar to those in the theory of monomial ideals to obtain an algorithm for computing the canonical form associated to any neural code providing the groundwork for inferring stimulus space features from neural activity alone
