

POGIL – DNA Structure and Replication

How is genetic information stored and copied?

Why?

Deoxyribonucleic acid or **DNA** is the molecule of heredity. It contains the genetic blueprint for life. For organisms to grow and repair damaged cells, each cell must be capable of accurately copying itself. So how does the structure of DNA allow it to copy itself so accurately?

Model 1 – The Structure of DNA

1. Refer to the diagram in Model 1.

- What are the three parts of a nucleotide?
- What kind of sugar is found in a nucleotide?
- Which nucleotide component contains nitrogen?
- Name the four nitrogen bases shown in Model 1.

2. DNA is often drawn in a "ladder model." Locate this drawing in Model 1.

- Circle a single nucleotide on each side of the ladder model of DNA.

- What part(s) of the nucleotides make up the rungs of the "ladder"?
- What parts of the nucleotides make up the sides (backbone) of the "ladder"?
- Look at the bottom and top of the "ladder" in Model 1. Are the rungs parallel (the ends of the strands match) or antiparallel (the ends of the strands are opposites)? Describe what antiparallel means.
- Label the 5' and 3' end of each strand in the ladder model of DNA in Model 1.

3. The two strands of DNA are held together with hydrogen bonds between the nitrogen bases. These are weak bonds between polar molecules. Which bases are paired together with hydrogen bonds? How many hydrogen bonds connect the bases of each pair? Draw and label a diagram showing each base pairing.

READ: Erwin Chargaff (1906–2002), an Austrian-American biochemist, investigated the ratio of nucleotide bases found in the DNA from a variety of organisms. From his research, as well as research by Rosalind Franklin and Maurice Wilkins, Watson and Crick developed the complementary base-pair rule during their race to discover the structure of DNA. The complementary base-pair rule states that adenine and thymine form pairs across two strands, and guanine and cytosine form pairs across two strands.

4. Fill in the complementary bases on the strand below according to the base-pair rule.

5' - A T C C A G C G G T C A A - 3'

5. The proportions of the bases are consistent within a species; however, they do vary between species. Using the base-pair rules, complete the following table to show the percentage of each type of base in the three different organisms.

Organism	Percentage of each type of base			
	Adenine	Guanine	Cytosine	Thymine
Human		31		19
Cow	28		22	
Salmon	21

DNA Replication Melvin L. DePamphilis, 2002 DNA Replication and Human Disease Melvin L. DePamphilis, 2006 At least 5 trillion cell divisions are required for a fertilized egg

to develop into an adult human resulting in the production of more than 20 trillion meters of DNA And yet with only two exceptions the genome is replicated once and only once each time a cell divides How is this feat accomplished What happens when errors occur This book addresses these questions by presenting a thorough analysis of the molecular events that govern DNA replication in eukaryotic cells The association between genome replication and cell proliferation disease pathogenesis and the development of targeted therapeutics is also addressed At least 160 proteins are involved in replicating the human genome and at least 40 diseases are caused by aberrant DNA replication 35 by mutations in genes required for DNA replication or repair 7 by mutations generated during mitochondrial DNA replication and more than 40 by DNA viruses Consequently a growing number of therapeutic drugs are targeted to DNA replication proteins This authoritative volume provides a rich source of information for researchers physicians and teachers and will stimulate thinking about the relevance of DNA replication to human disease

Proteins Involved in DNA Replication Ulrich Huebscher, 2012-12-27 This book collects the Proceedings of a workshop sponsored by the European Molecular Biology Organization EMBO entitled Proteins Involved in DNA Replication which was held September 19 to 23 1983 at Vitznau near Lucerne in Switzerland The aim of this workshop was to review and discuss the status of our knowledge on the intricate array of enzymes and proteins that allow the replication of the DNA Since the first discovery of a DNA polymerase in *Escherichia coli* by Arthur Kornberg twenty eight years ago a great number of enzymes and other proteins were described that are essential for this process different DNA polymerases DNA primases DNA dependent ATPases helicases DNA ligases DNA topoisomerases exonucleases DNA binding proteins and others They are required for the initiation of a round of synthesis at each replication origin for the progress of the growing fork for the disentanglement of the replication product or for assuring the fidelity of the replication process The number variety and ways in which these

proteins interact with DNA and with each other to the achievement of replication and to the maintenance of the physiological structure of the chromosomes is the subject of the contributions collected in this volume. The presentations and discussions during this workshop reinforced the view that DNA replication in vivo can only be achieved through the cooperation of a high number of enzymes, proteins and other cofactors. DNA Replication Sonya Vengrova, Jacob Dalgaard, 2016-10-29. Updated and revised, this thorough volume covers a range of methods focusing on systems including mammalian, yeast, bacterial and archaeal. This second edition of *DNA Replication Methods and Protocols* describes approaches to analyze whole genomes to single molecules as well as both in vivo and in vitro experiments. As a volume in the highly successful *Methods in Molecular Biology* series, chapters contain introductions to their respective topics, lists of the necessary materials and reagents, step by step, readily reproducible protocols and tips on troubleshooting and avoiding known pitfalls.
