in current issues such as urban water quality biologically active compounds and biofilms Green Nanoremediation Fernanda Maria Policarpo Tonelli, Arpita Roy, H C Ananda Murthy, 2023-06-22 This book focuses on green nanoremediation addressing aspects related to the use of nanomaterials generated through green synthesis protocols to efficiently restore polluted environs. Nanomaterials characteristics such as large surface area capacity to easily reach into contaminated sites good reactivity and possibility of being developed to present photocatalytic activity and or to deal with targeted substances by chemical surface modification are useful specially to perform remediation. As an alternative to conventional physicochemical methods the green based synthesis protocols reject the use of harmful reagents prevent waste production apply renewable energy source and or materials and consider in first place offering the smallest negative impact possible to living beings and to the ecosystem. Green synthesis in nanotechnology field involves the use of seaweeds bacteria cyanobacteria yeasts fungi plants living ones biomass extracts and or bio derived products to generate the nanomaterials. The introductory chapter will be dedicated to nanomaterials characteristics that enable them to be used in environmental remediation. The first part of the book will be dedicated to organic and inorganic pollution and the threats they pose to living forms advantages disadvantages and mechanisms of nanoremediation comparison between conventional strategies of environmental pollution remediation and the green nanoremediation carbon based and non carbon based green nanomaterials capable of promoting environs remediation cost benefits of using nanomaterials and nanoinformatics to a safe nanotechnology. The second part will be dedicated to green nanoremediation of water and soil microbe based algae based and plant based synthesis of nanomaterials to nanoremediation. This part will also contain chapters dedicated to relevant nanomaterials for green nanoremediation protocols nano phytoremediation strategies strategies to evaluate the efficiency of protocols related to this kind of remediation main interactions of green nanomaterials and microbes during nanoremediation and as a consequence of it biocompatibility of green nanomaterials. This book's main purpose is to offer readers extensive knowledge on green nanoremediation as a feasible strategy to fight pollution's harmful consequences and clean environmental pollution but also present the challenges that should be surpassed **Holt Science and Technology** Holt, Rinehart and Winston Staff, 2000-12 **Digital innovation in citizen science to enhance water quality monitoring in developing countries** Pattinson, N. B., Taylor, J., Dickens, Chris W. S., Graham, P. M., 2023-12-31 Freshwater systems are disproportionately adversely affected by the ongoing global environmental crisis. The effective and efficient water resource conservation and management necessary to mitigate the crisis requires monitoring data especially on water quality. This is recognized by Sustainable Development Goal SDG 6 particularly indicator 6.3.2 which requires all UN member states to measure and report the proportion of water bodies with good ambient water quality. However gathering sufficient data on water quality is reliant on data collection at spatial and temporal scales that are generally outside the capacity of institutions using conventional methods. Digital technologies such as wireless sensor networks and remote sensing have come to the fore

as promising avenues to increase the scope of data collection and reporting Citizen science which goes by many names e.g participatory science or community based monitoring has also been earmarked as a powerful mechanism to improve monitoring However both avenues have drawbacks and limitations The synergy between the strengths of modern technologies and citizen science presents an opportunity to use the best features of each to mitigate the shortcomings of the other This paper briefly synthesizes recent research illustrating how smartphones sometimes in conjunction with other sensors present a nexus point method for citizen scientists to engage with and use sophisticated modern technology for water quality monitoring This paper also presents a brief non exhaustive research synthesis of some examples of current technological upgrades or innovations regarding smartphones in citizen science water quality monitoring in developing countries and how these can assist in objective comprehensive and improved data collection management and reporting While digital innovations are being rapidly developed worldwide there remains a paucity of scientific and socioeconomic validation of their suitability and usefulness within citizen science This perhaps contributes to the fact that the uptake and upscaling of smartphone assisted citizen science continues to underperform compared to its potential within water resource management and SDG reporting Ultimately we recommend that more rigorous scientific research efforts be dedicated to exploring the suitability of digital innovations in citizen science in the context of developing countries and SDG reporting
