range and by extending their operation to infrared wavelengths Near infrared NIR SiGe photodetectors have been demonstrated to have a zero change CMOS process flow while the investigation of new effects and structures has shown that an all Si approach could be a viable option to construct devices comparable with Ge technology In addition the capability to integrate new emerging 2D and 3D materials with Si together with the capability of manufacturing devices at the nanometric scale has led to the development of new device families with unexpected performance Accordingly this Special Issue of Micromachines seeks to showcase research papers short communications and review articles that show the most recent advances in the field of silicon photodetectors and their respective applications **Research and Development Progress**

Materials 2007 A.G. Cullis,P.A. Midgley,2008-12-02 This volume contains invited and contributed papers presented at the conference on Microscopy of Semiconducting Materials held at the University of Cambridge on 2 5 April 2007 The event was organised under the auspices of the Electron Microscopy and Analysis Group of the Institute of Physics the Royal Microscopical Society and the Materials Research Society This international conference was the fifteenth in the series that focuses on the most recent world wide advances in semiconductor studies carried out by all forms of microscopy and it

attracted delegates from more than 20 countries With the relentless evolution of advanced electronic devices into ever smaller nanoscale structures the problem relating to the means by which device features can be visualised on this scale becomes more acute This applies not only to the imaging of the general form of layers that may be present but also to the determination of composition and doping variations that are employed In view of this scenario the vital importance of transmission and scanning electron microscopy together with X ray and scanning probe approaches can immediately be seen The conference featured developments in high resolution microscopy and nanoanalysis including the exploitation of recently introduced aberration corrected electron microscopes All associated imaging and analytical techniques were demonstrated in studies including those of self organised and quantum domain structures Many analytical techniques based upon scanning probe microscopies were also much in evidence together with more general applications of X ray diffraction methods
