Earth's Interior Layers

- The Earth is not entirely the same all the way throughout the inside of the planet. Instead, Earth is made up of distinct layers that have their own characteristics and composition. This means they are made of different materials and behave differently from one another.
- We do not know for sure what any of the layers inside of Earth look like because we have not been able to look inside but scientists studied how earthquakes moved through the Earth in order to infer what the inside of the Earth is like.
- There are two different types of crust – oceanic and continental.
 - Oceanic crust is found under the oceans. It is thinner and more dense than continental crust. This means that if it comes into contact with a continental plate, it will sink in a process called **subduction**.
 - Continental crust is found on land. It is thicker and less dense than oceanic crust. This means that if it comes into contact with an oceanic plate, it will 'over-ride' the plate and go on top of it.
- Underneath the crust is the thickest layer of the Earth's interior, the mantle. This area is solid but behaves like a liquid due to being so hot and under pressure. There are two distinct parts of the mantle.
 - The upper mantle (asthenosphere) and the lower mantle.
- The asthenosphere and crust stick together – this is called the lithosphere. When we refer to tectonic plates, we are referring to the lithosphere.
- Plate movement is caused by convection currents in the lower mantle.

In the lower mantle, rock heats up and cools down. Mass of rock is able to rise up

Geology and Mineral Resources of West Africa Wright, 2012-12-06 In this text attention is focused mainly on those literature is accessible however it is to be expected countries in western Africa lying south of the Sahara that teachers and lecturers will know of it and will be that is between about 5°N and 15°N and westward able to acquaint their students with it where necessary of about 15°E Parts of the region as far north as 20°N are considered from time to time for A glossary of terms is provided at the end of the purposes of correlation and continuity The map on volume and there is a summary at the beginning of p xiii indicates the approximate extent of the cover each chapter age This book is dedicated to the many colleagues and The principal aim is to provide a broad view of students with whom we have worked in West Africa West African geology as a whole for undergraduates and who have stimulated and encouraged our teaching who are studying for honours degrees in geology and engineering and research in various ways We hope also that it may help the work of international organizations who already have an understanding of basic geological principles It is increasingly important that such as AGID CIFE and UNESCO to encourage the growing trend towards geological cooperation geologists working in this region should see it as made up of geological provinces which transcend and correlation between different countries in West national boundaries Africa
