

Deer: Predation or Starvation?

Introduction: In 1970 the deer population of an island forest reserve about 11.8 square kilometers in size was about 2000 animals. Although the island had excellent vegetation for feeding, the food supply obviously had limits. Thus the forest management personnel feared that overgrazing might lead to mass starvation. Since the area was too remote for hunters, the wildlife service decided to bring in natural predators to control the deer population. It was hoped that natural predation would keep the deer population from becoming too large and also increase the deer quality (or health), as predators often eliminate the weaker members of the herd. In 1975, ten wolves were flown into the island.

The results of this program are shown in the following table. The population change is the number of deer born minus the number of deer that died during that year. Fill out the last column for each year (the first has been calculated for you).

Year	Wolf Population	Deer Population	Deer Offspring	Predation	Starvation	Deer Population Change
1970	0	2,000	500	0	0	-500
1971	0	2,500	625	0	0	
1972	0	2,500	5,000	0	0	
1973	0	2,500	625	0	0	
1974	0	2,500	625	0	0	
1975	10	2,500	625	1,500	0	
1976	10	2,000	500	0	0
